

My container is running stable since a year,  
is that good?

---

# Patch Management in 2009

---

My server is running stable since a year

\$ uptime  
12:52:27 up 463 days, [...]

# My container is running stable since a year

---

Conclusions?

# My container is running stable since a year

---

Conclusions?

→ Container has not been rebuild since a year

# My container is running stable since a year

---

## Conclusions?

- Container has not been rebuild since a year
  - No patches
- Host has not been restarted since a year
  - No patches (at least for docker), no kernel updates

# Vulnerabilities

---

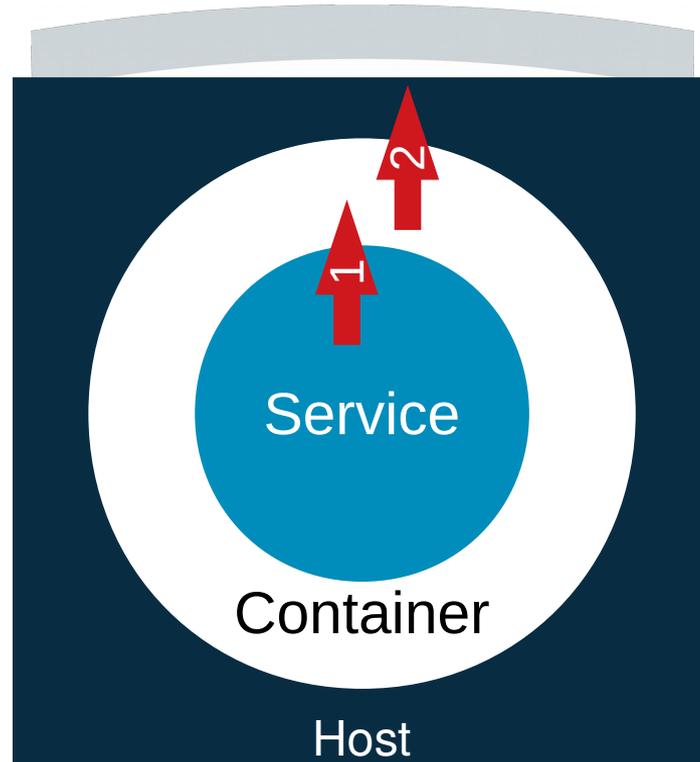

Shellshock, 2014

→ privilege escalation

→ run arbitrary commands

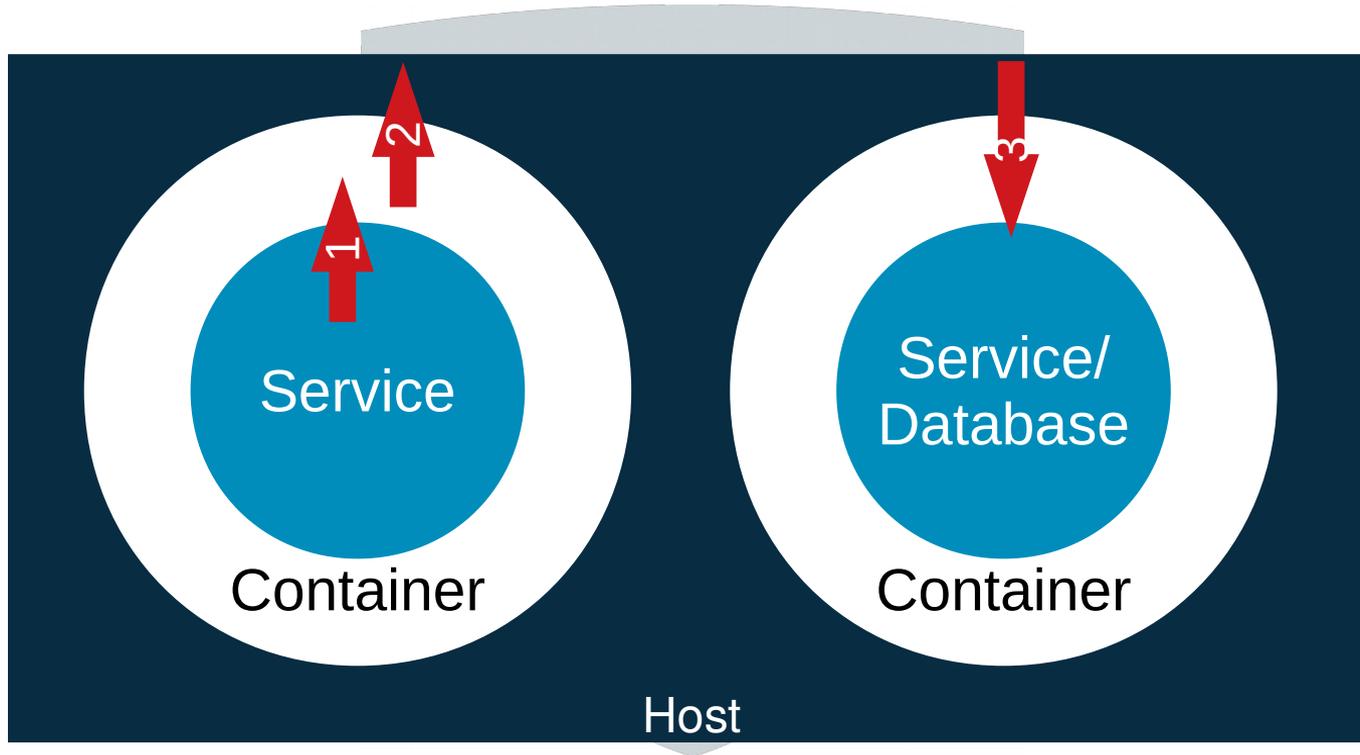

# Container Breakout

---

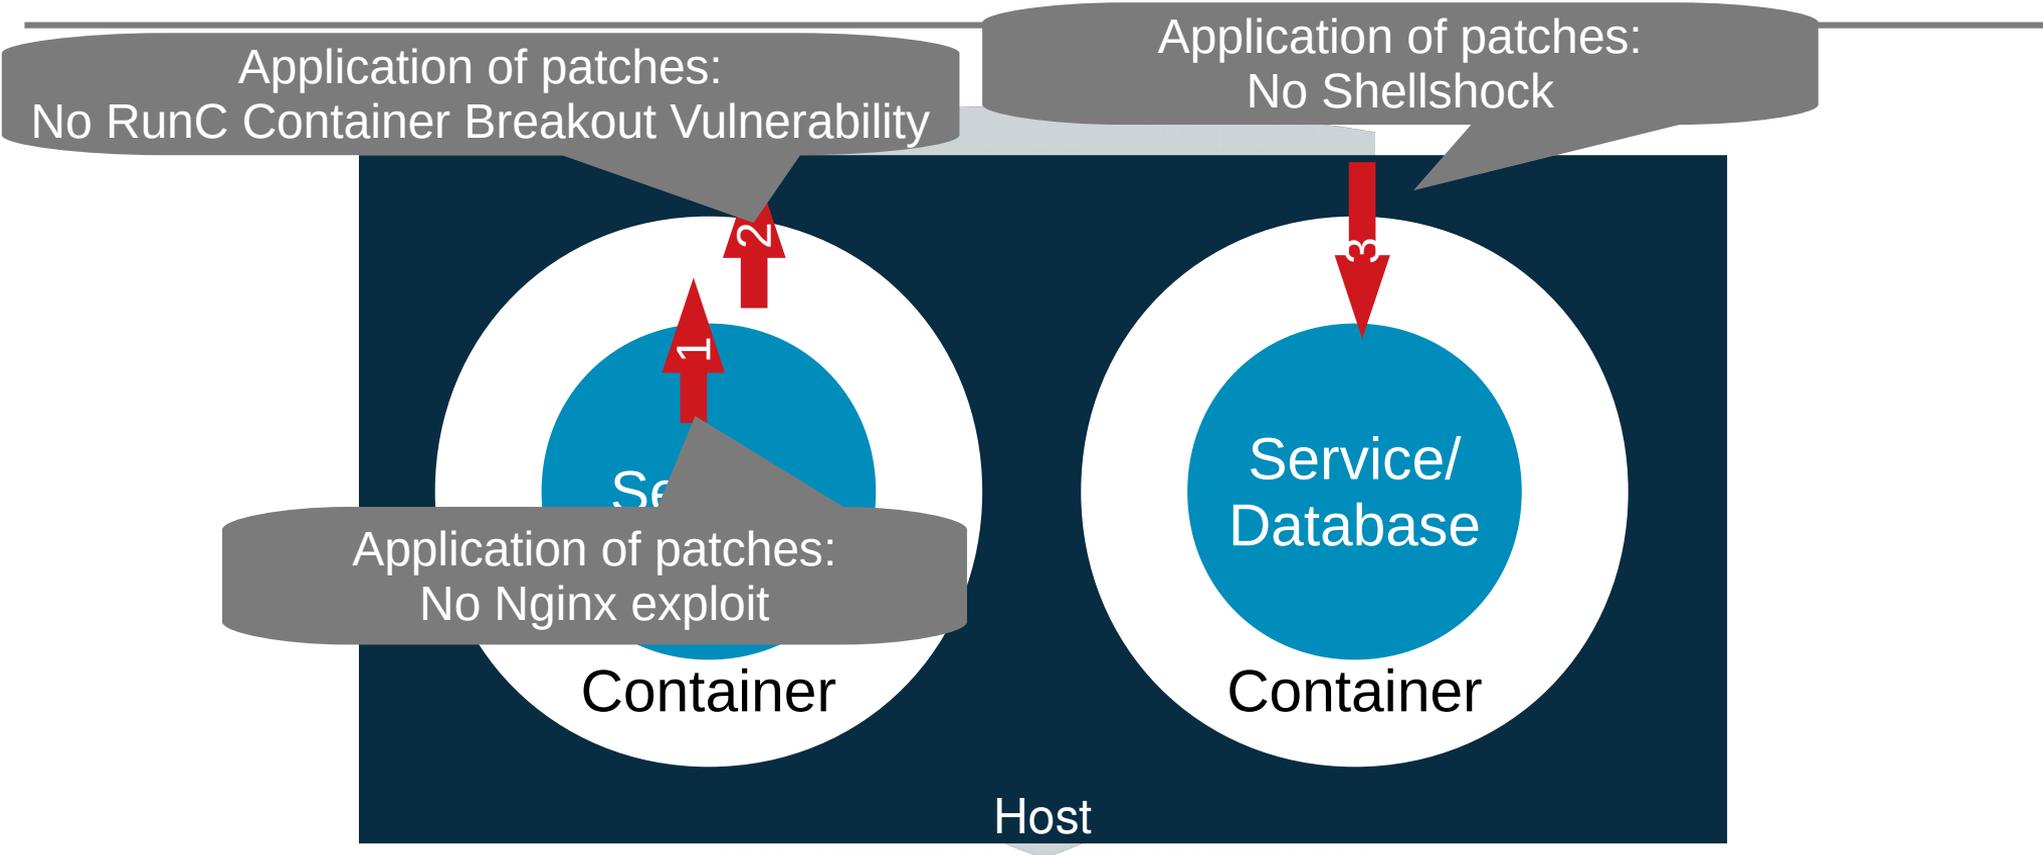

# Container Breakout and more

---

# Container Breakout and Patches

# Strategies

---

- Attack surface reduction
- Scan for vulnerabilities
- Fast patching

# Agenda

---

- Introduction
- **Attack Surface Reduction**
- Scanning for Known Vulnerabilities
- Fast Patching
- Conclusion

# Attack Surface Reduction

---

- Careful selection of distribution

# Distribution Selection

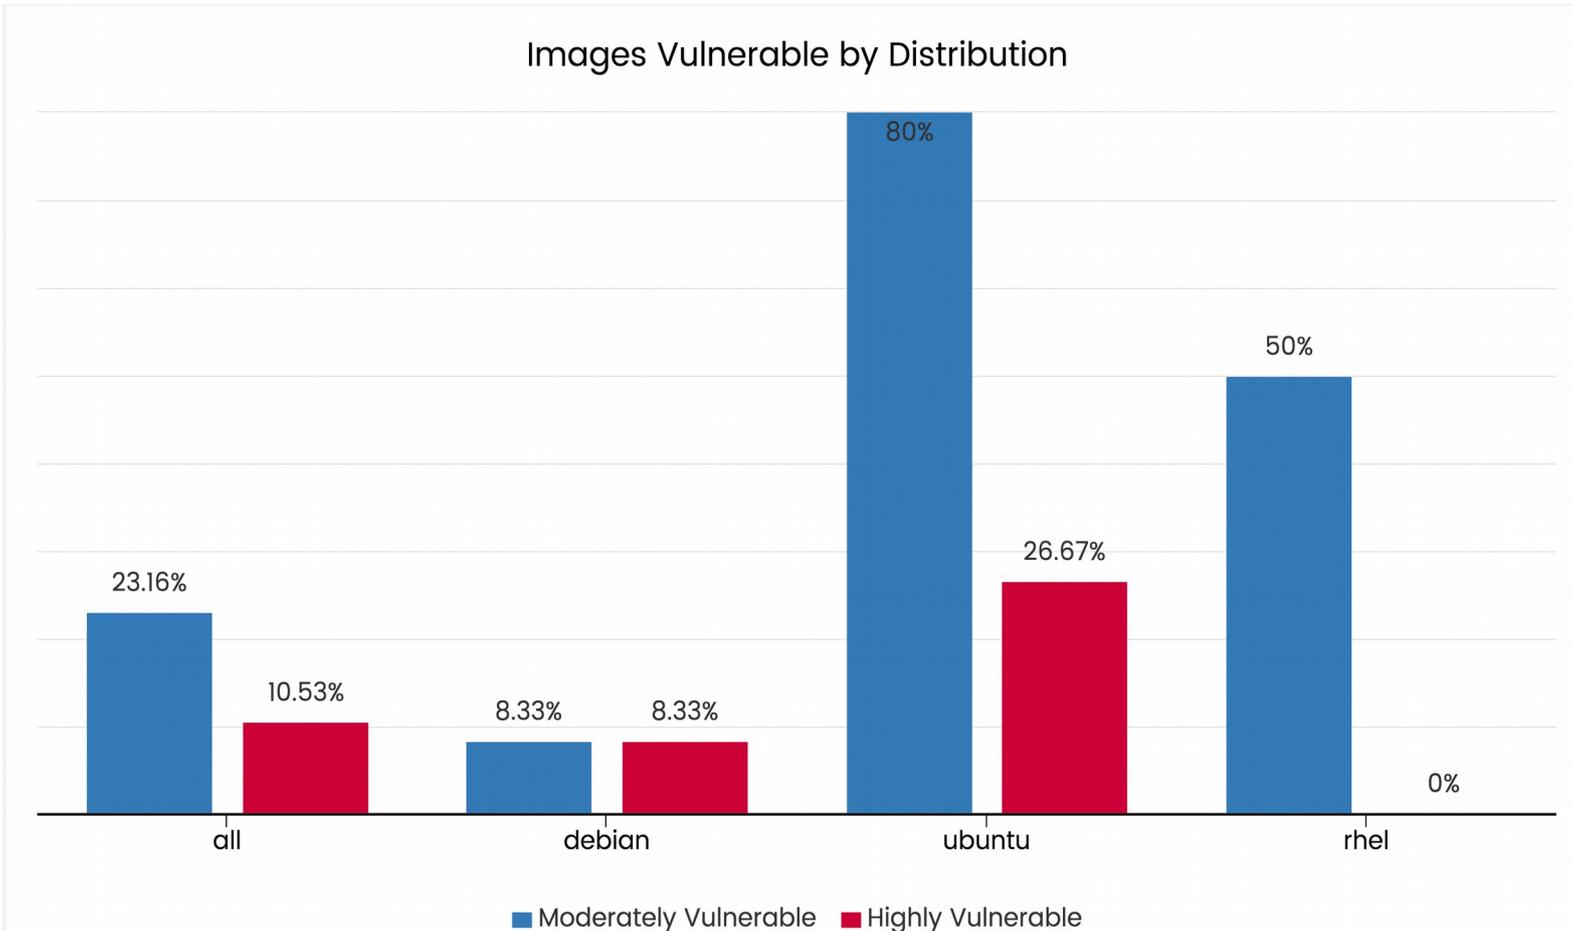

---

- Vulnerabilities
- Speed of providing patches
- Size
- Maintainability
- Stability

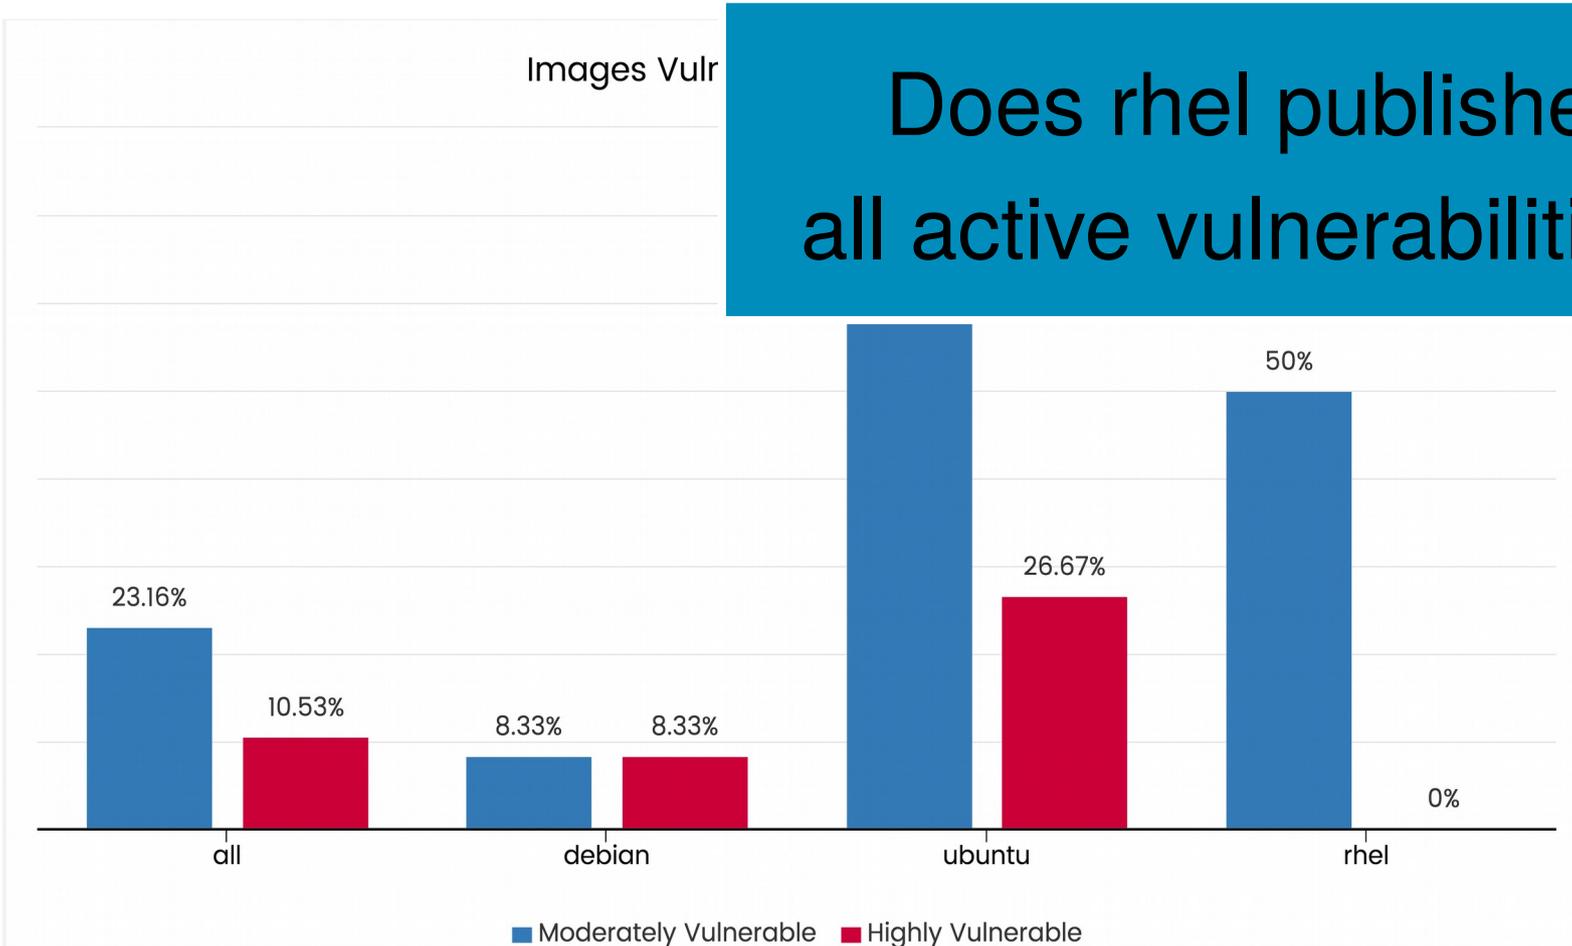

research done with Hendrik Halkow

# Image Vulnerable by Distribution

Source: <https://www.infoq.com/news/2017/03/docker-image-vulnerabilities>

# Image Vulnerable by Distribution

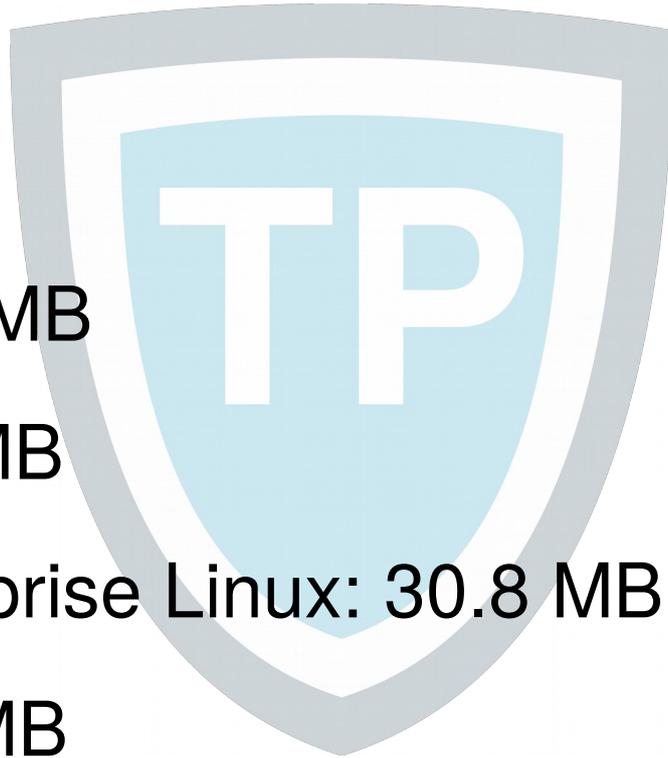

Source: <https://www.infoq.com/news/2017/03/docker-image-vulnerabilities>

# OS Selection

---

- Image size:
  - Alpine: 2.6 MB
  - CentOS: 71.9 MB
  - Debian: 18.3 MB
  - Red Hat Enterprise Linux: 30.8 MB
  - Ubuntu: 31.0 MB

# OS Selection

---

- Image size:
  - Alpine: 2.6 MB
  - CentOS: 71.9 MB
  - Debian: 18.3 MB
  - Red Hat Enterprise Linux: 30.8 MB
  - Ubuntu: 31.0 MB

Does a small image size  
imply less vulnerabilities?

# Maintainability

---

- Custom *glibc* and *bash* in Alpine
  - Usage of additional *pkg-glibc* in Alpine
  - Not compatible with most Java versions

*glibc* provides API to the kernel, e.g. *open*, *read*, *write*, *malloc*, ...

A manually added Java compatible *glibc* needs to be added

# Distroless

---

Copy only needed files to production images

→ No shell in container

# Distroless

---

- Advantages:

- Less vulnerable files

- Disadvantages:

- Requires knowledge
- For development purpose: original distribution

Hint:

- Scan the original image
- Results in a lot of false positives

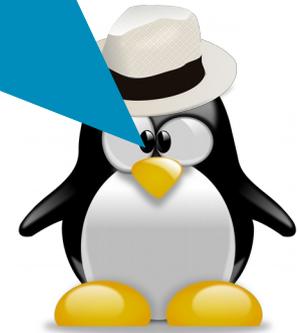

# Agenda

---

- Introduction
- Attack Surface Reduction
- Scanning for Known Vulnerabilities
- Fast Patching
- Conclusion

---

Whom of you is scanning images  
for known vulnerabilities?

# Scanning for Known Vulnerabilities

---

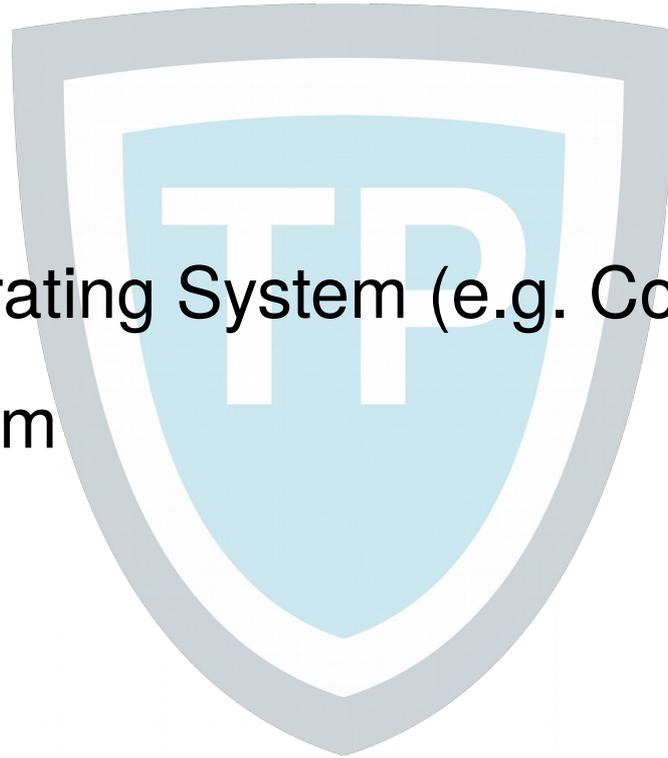

- What?
- How?
- When?
- Who?

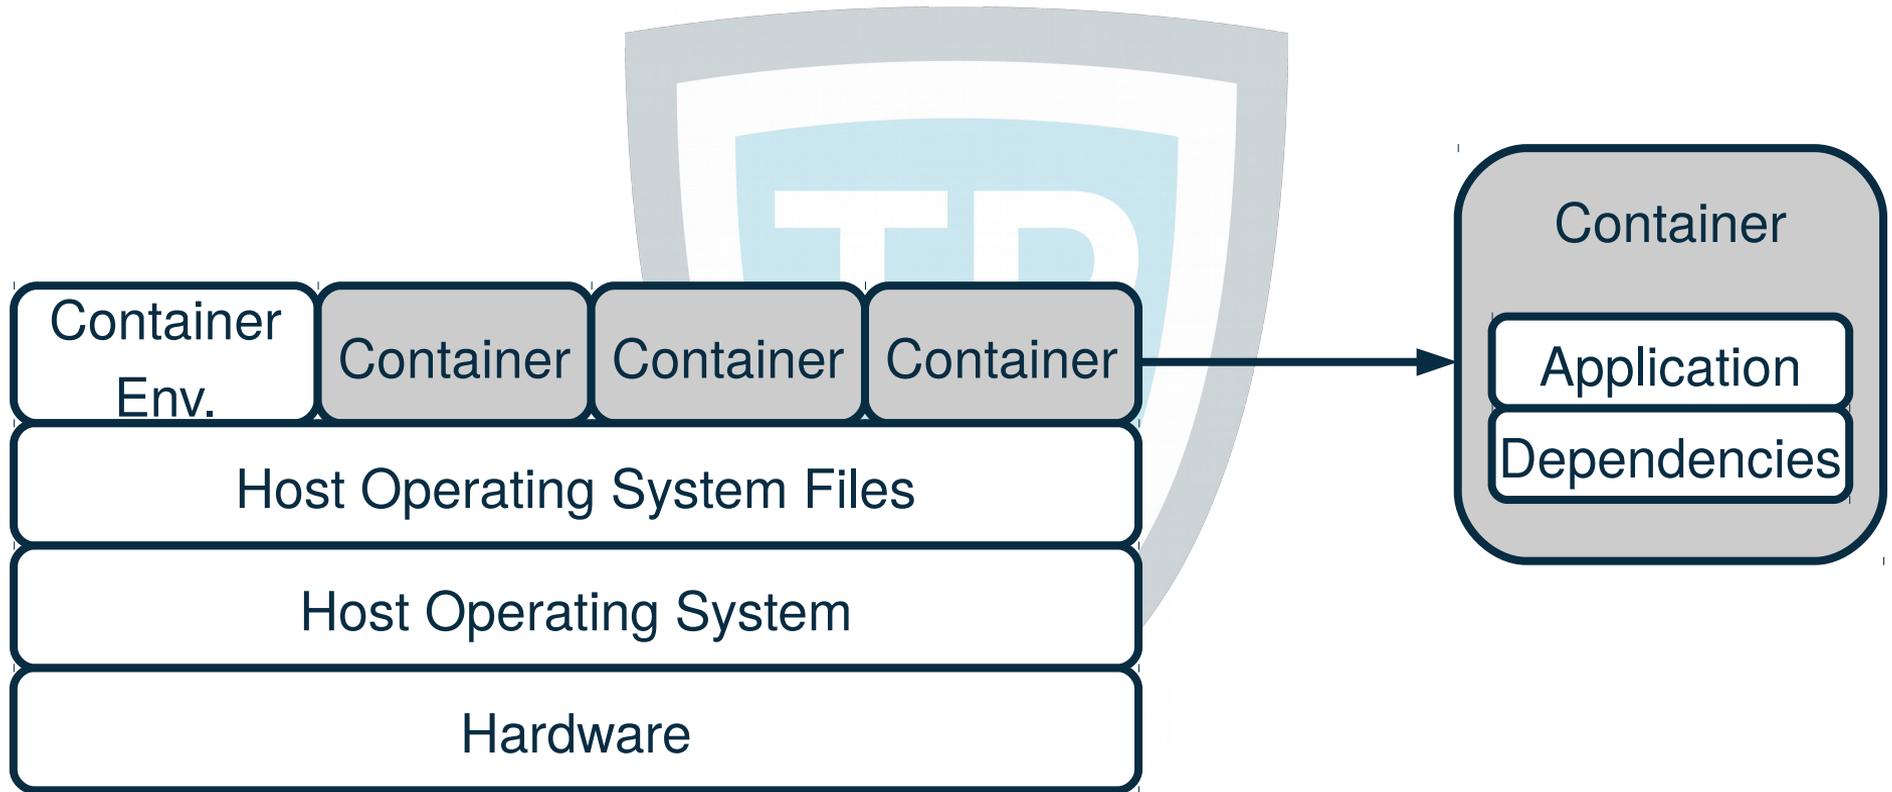

# Detection of Components with Known Vulnerabilities

---

- What?
  - Application
  - Virtualized Operating System (e.g. Container)
  - Operating System
- How?
- When?
- Who?

# Docker

# Scanning for Known Vulnerabilities

---

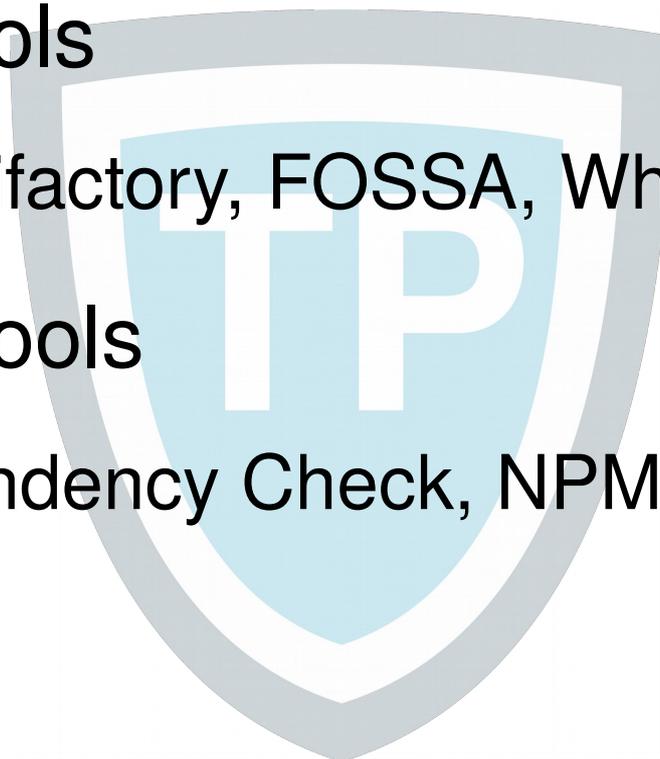

- What?
- How?
- When?
- Who?

# Scan for Vulnerable **Application** Dependencies

---

- Commercial Tools
  - Blackduck, Artifactory, FOSSA, Whitesource, ...
- Open Source Tools
  - OWASP Dependency Check, NPM, ...

# Scan for Vulnerable Image/Container Dep.

---

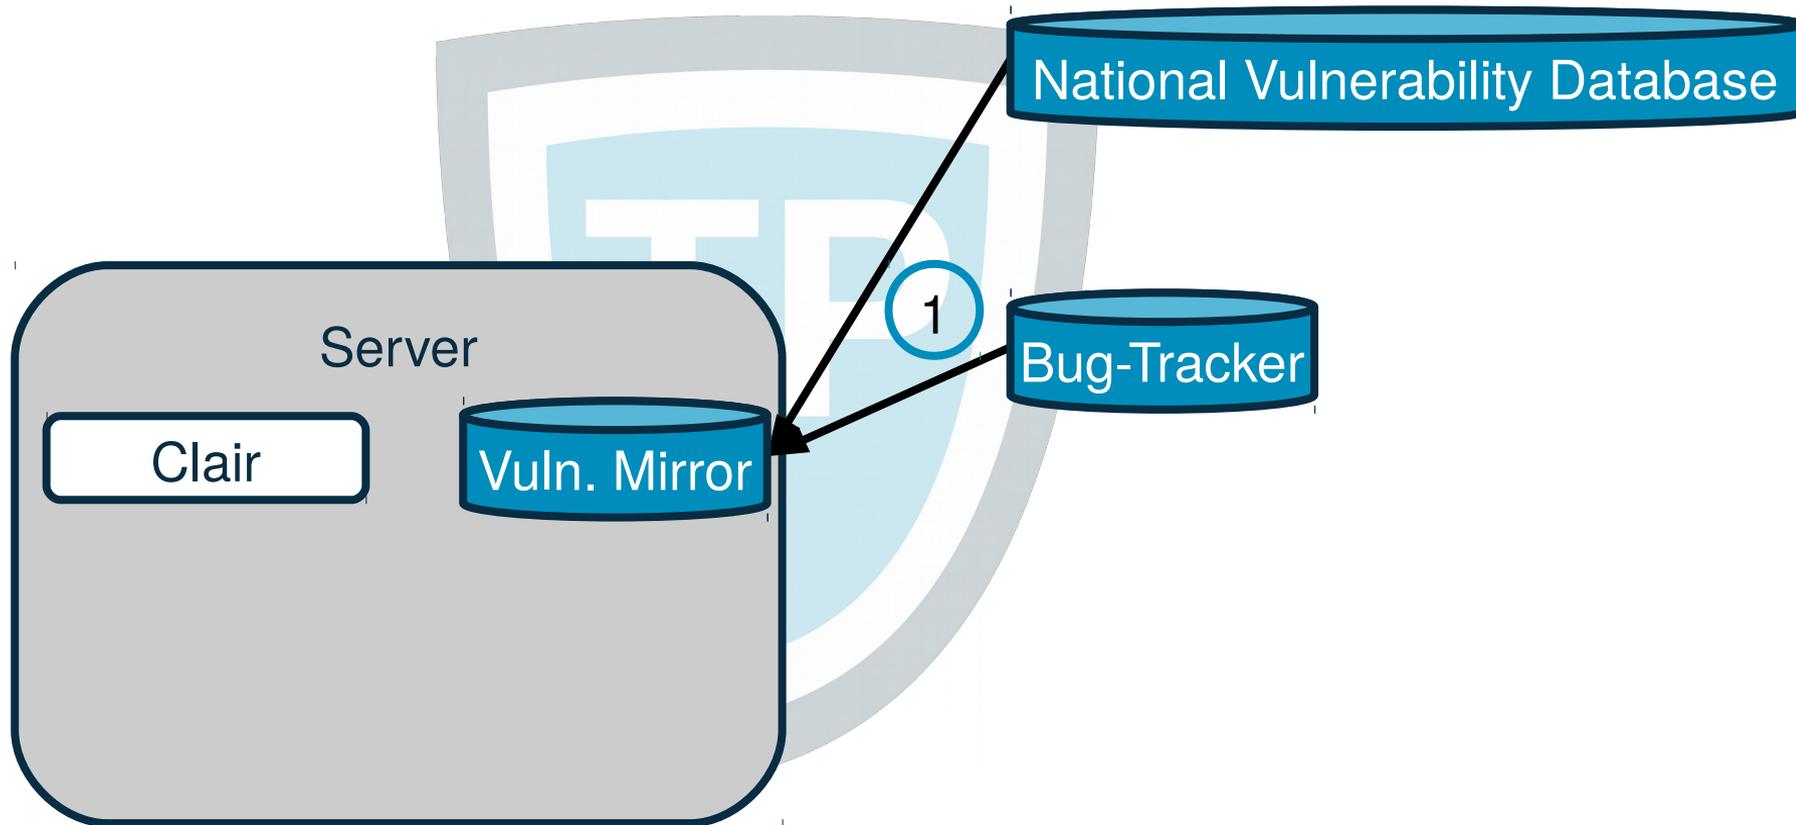

- Commercial Tools
  - Anchore, Artifactory, Blackduck, hub.docker.com, Tenable.io® Container Security, ...
- Open Source Tools
  - Anchore, CoreOS Clair, OpenSCAP, ...

# Approaches

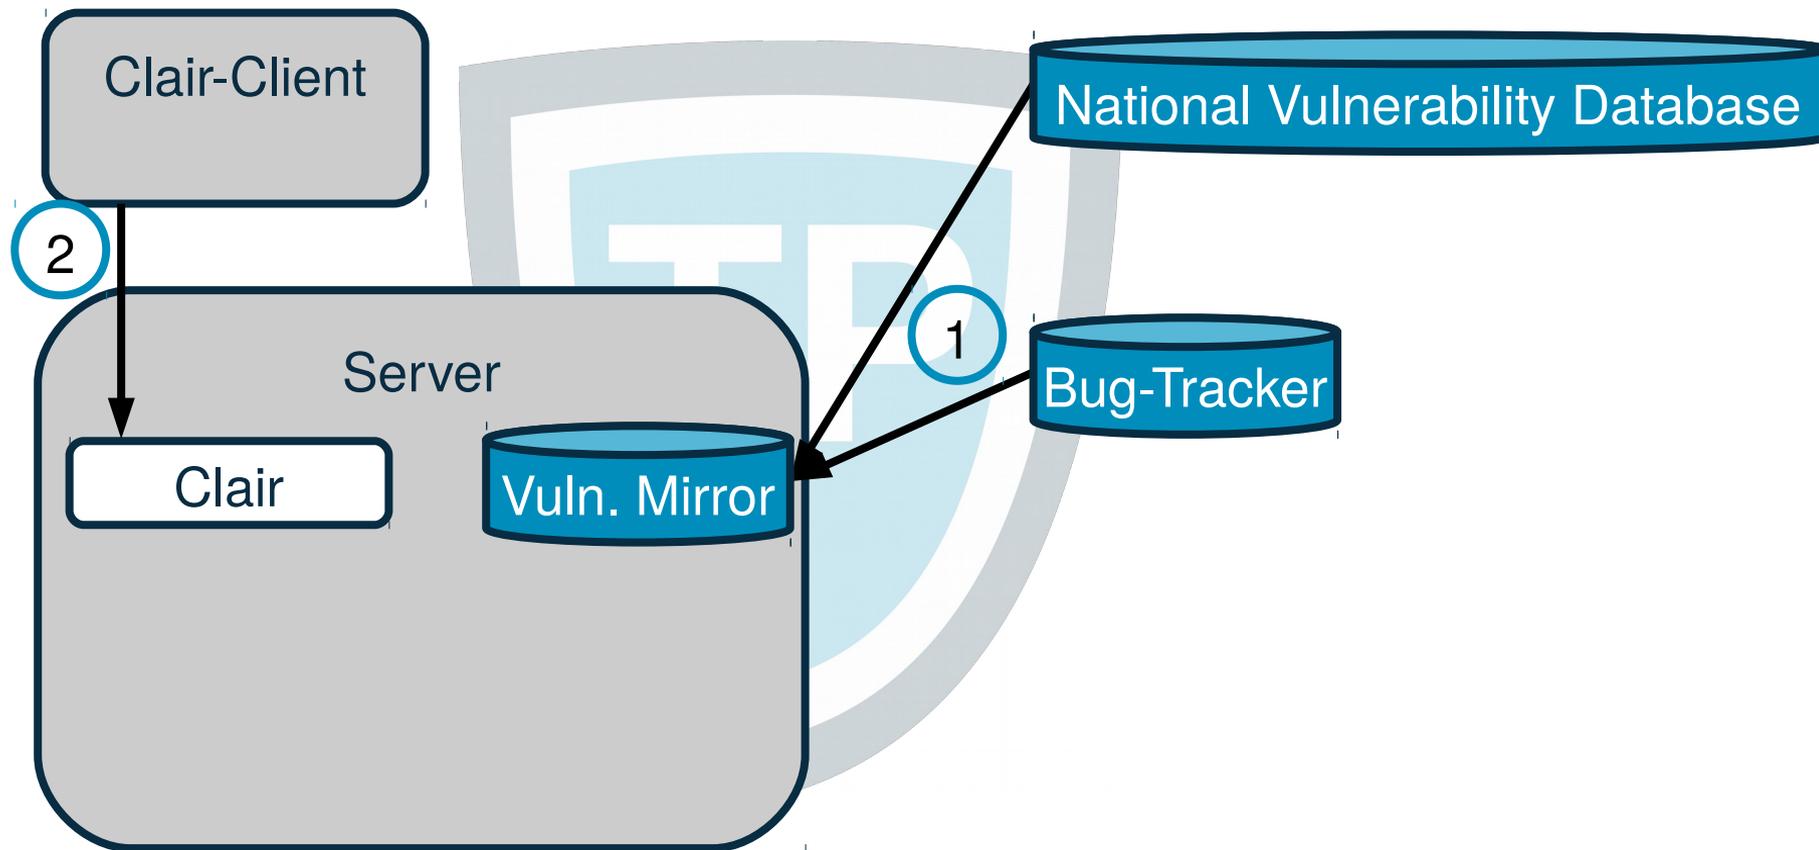

---

- Identification of dependencies incl. version
  - Package managers (App/OS)
  - Fingerprinting (Hash-Sums) of artifacts
  - Pattern recognition
- Vulnerability sources
  - National Vulnerability Database
  - Feeds (e.g. bug tracker)

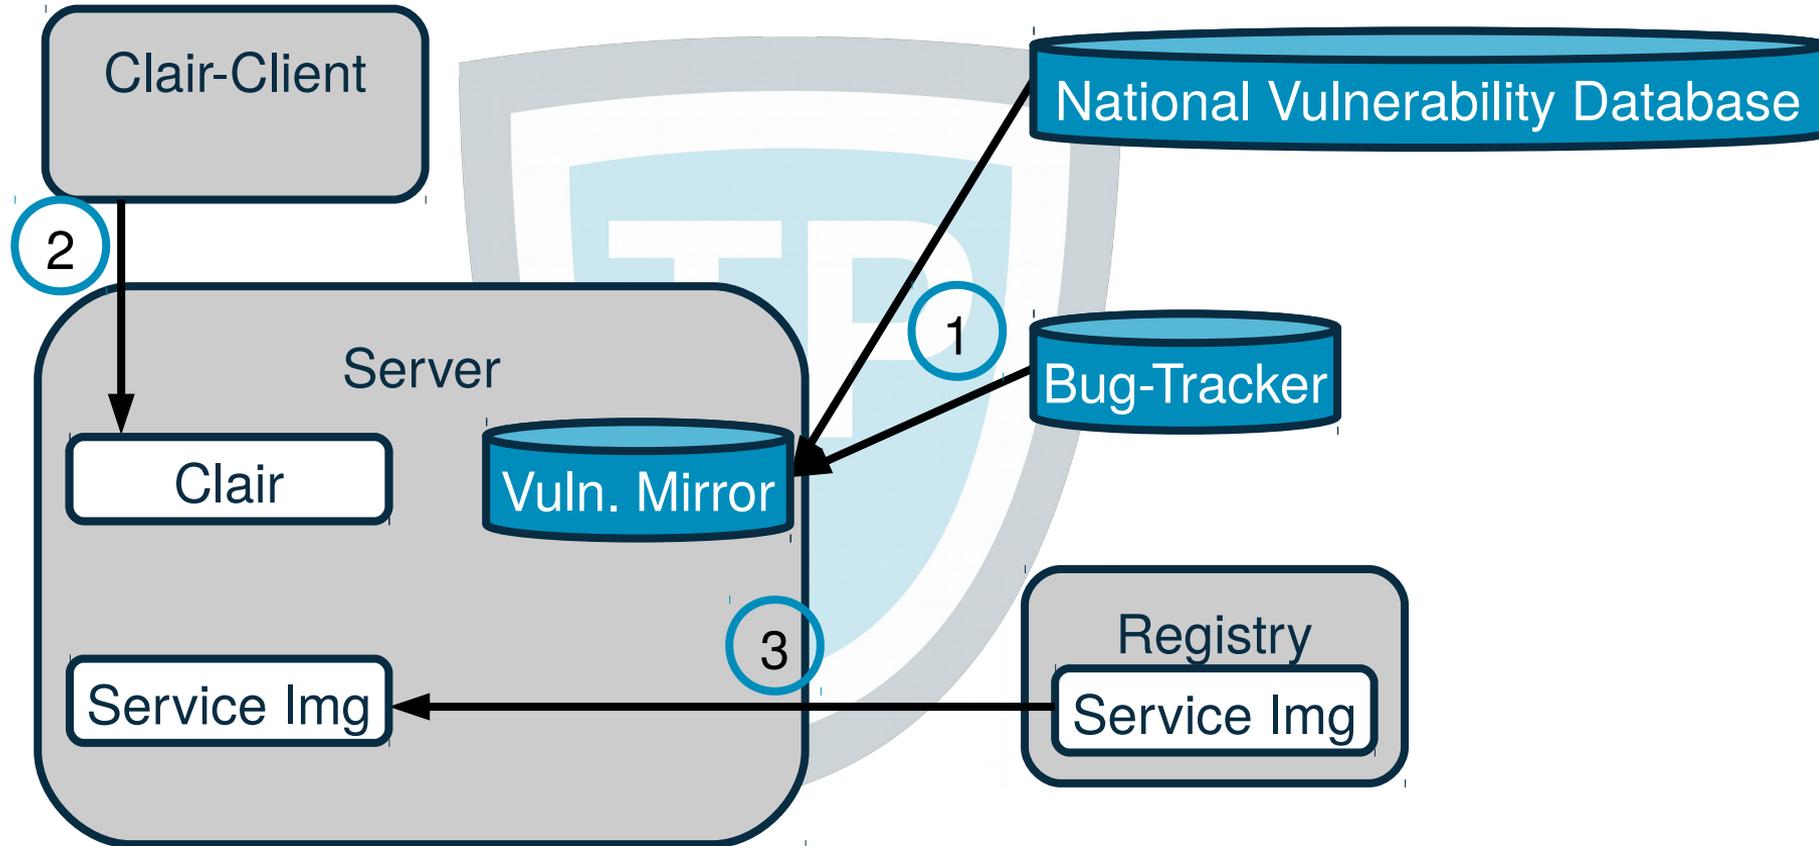

# Approach on Example of Clair

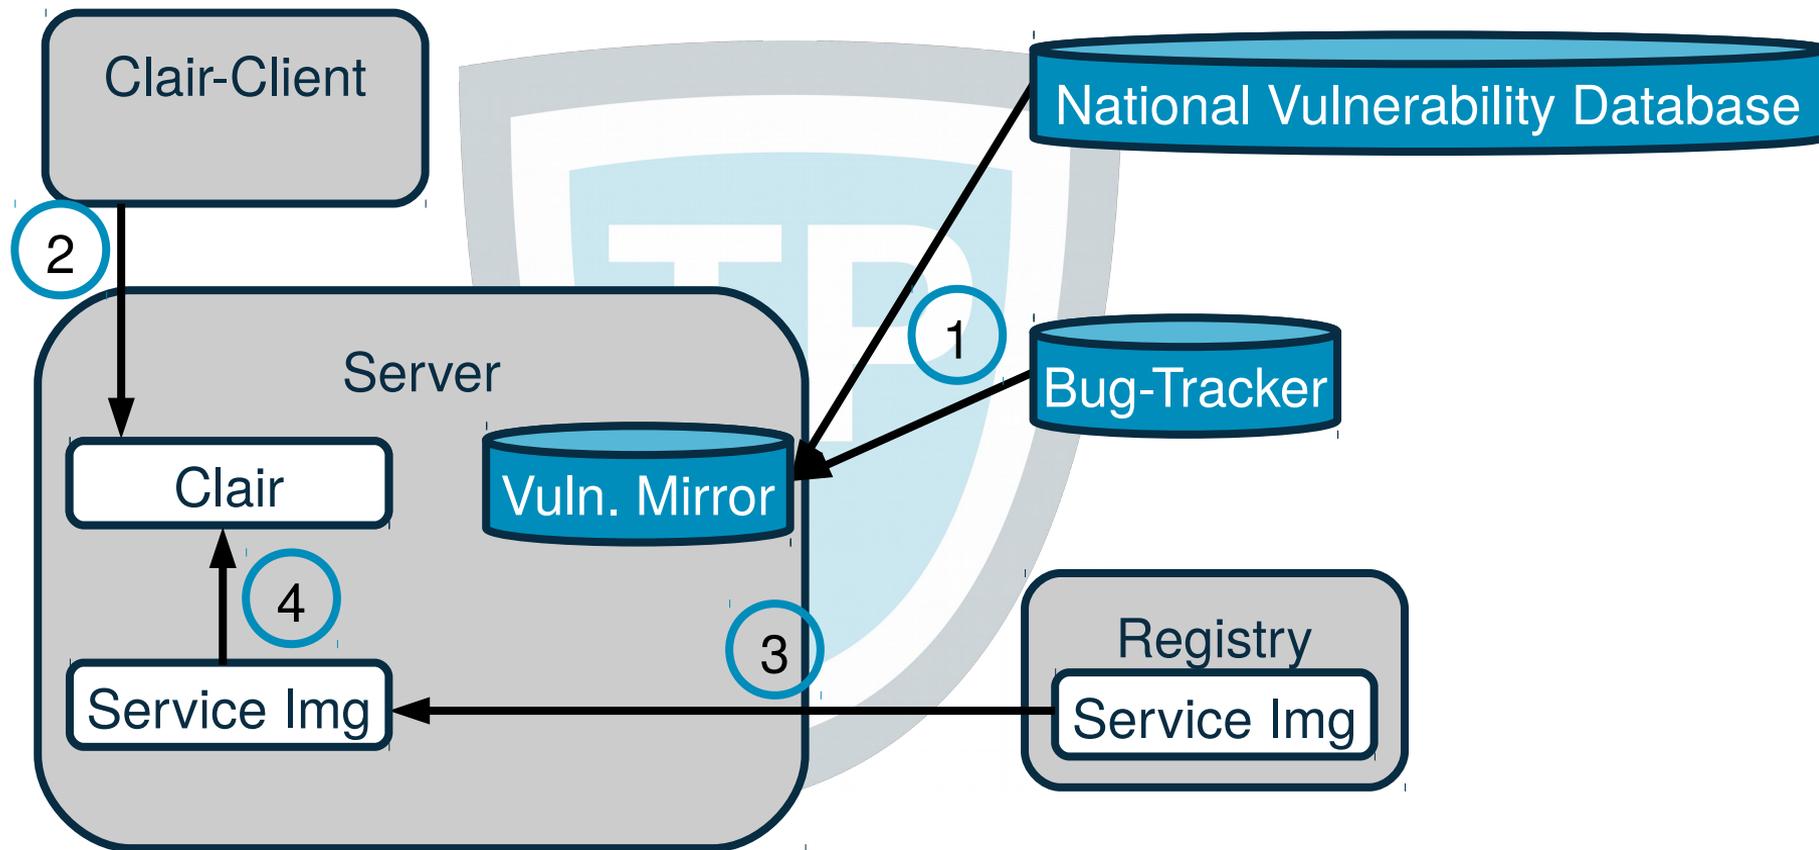

# Approach on Example of Clair

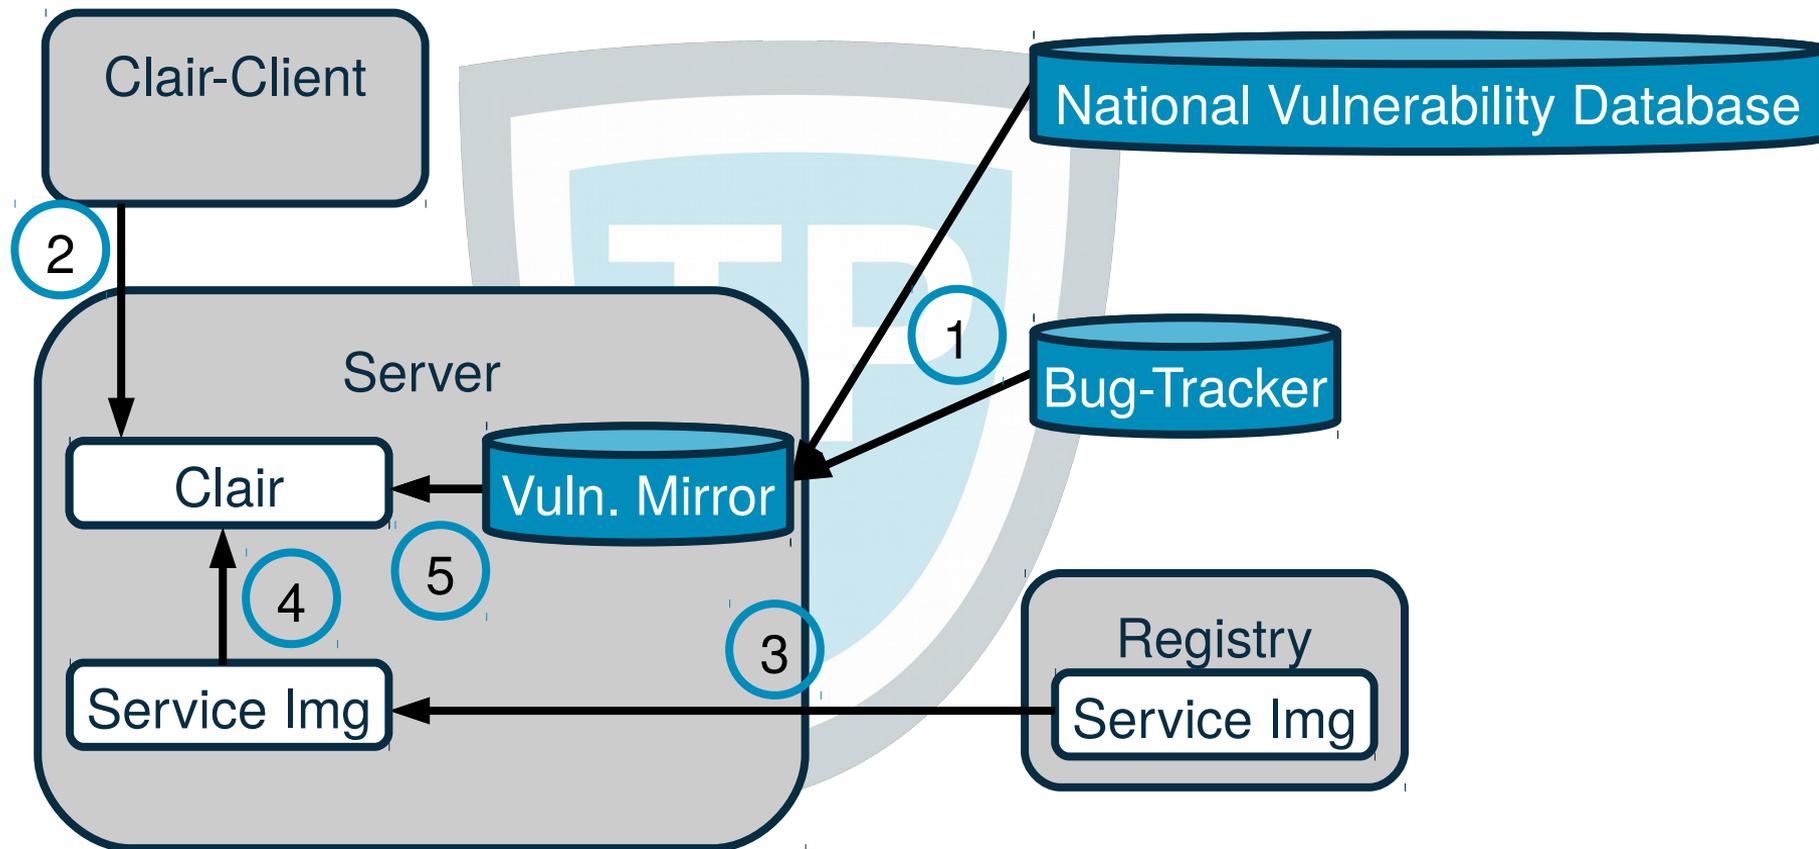

# Approach on Example of Clair

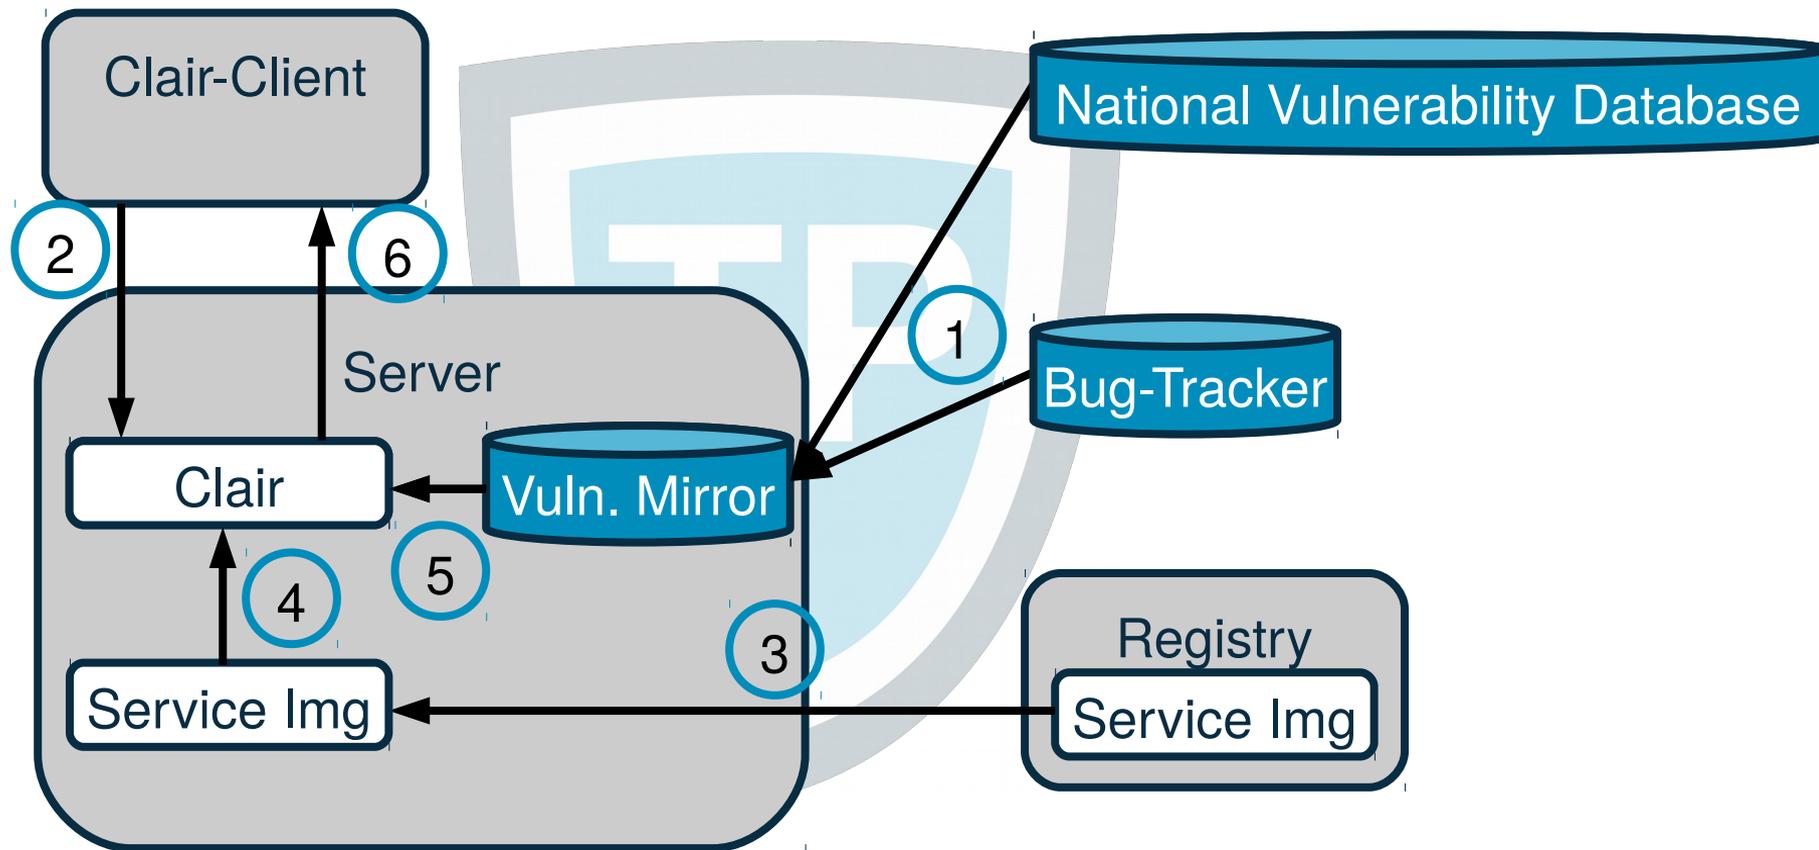

# Approach on Example of Clair

# Approach on Example of Clair

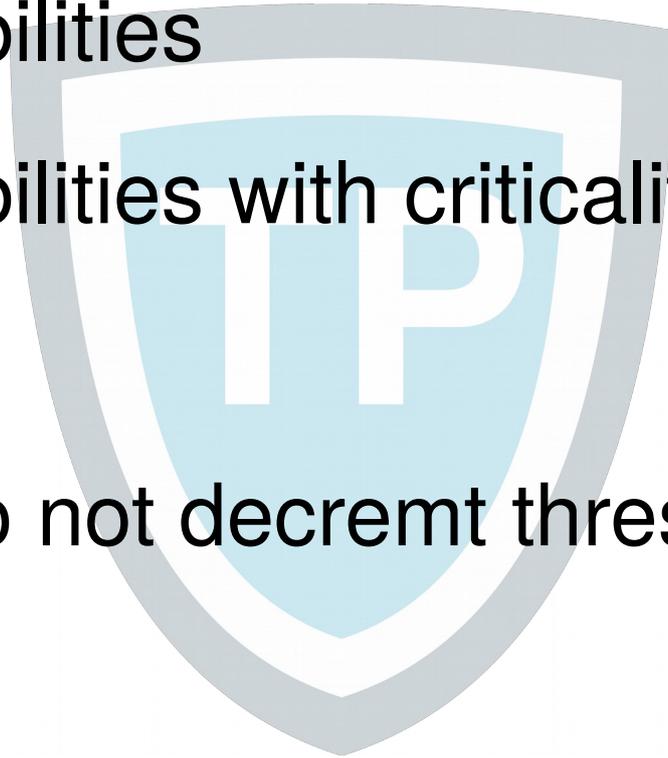

# Approach on Example of Clair

# Quality Gates: Thresholds

---

- Only  $n$  vulnerabilities
- Only  $n$  vulnerabilities with criticality *High*
- Dev and ops do not decremth thresholds!

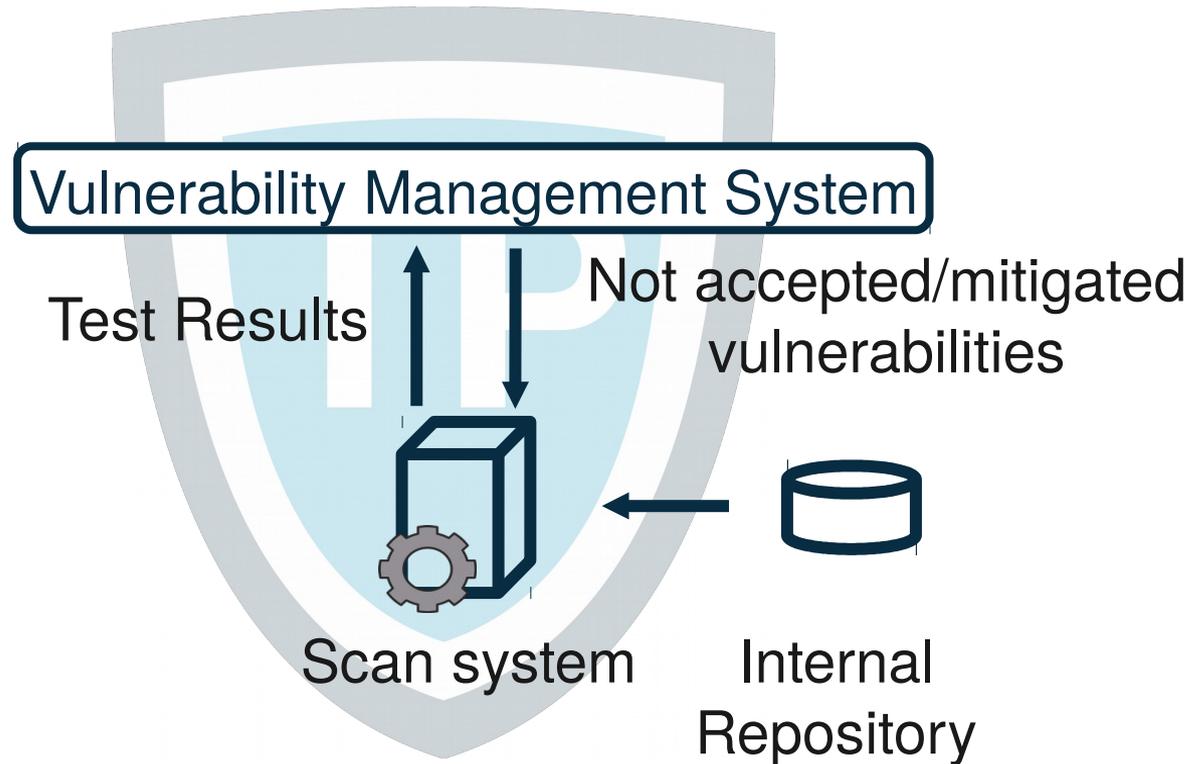

# Quality Gates in Regulated Organisations

---

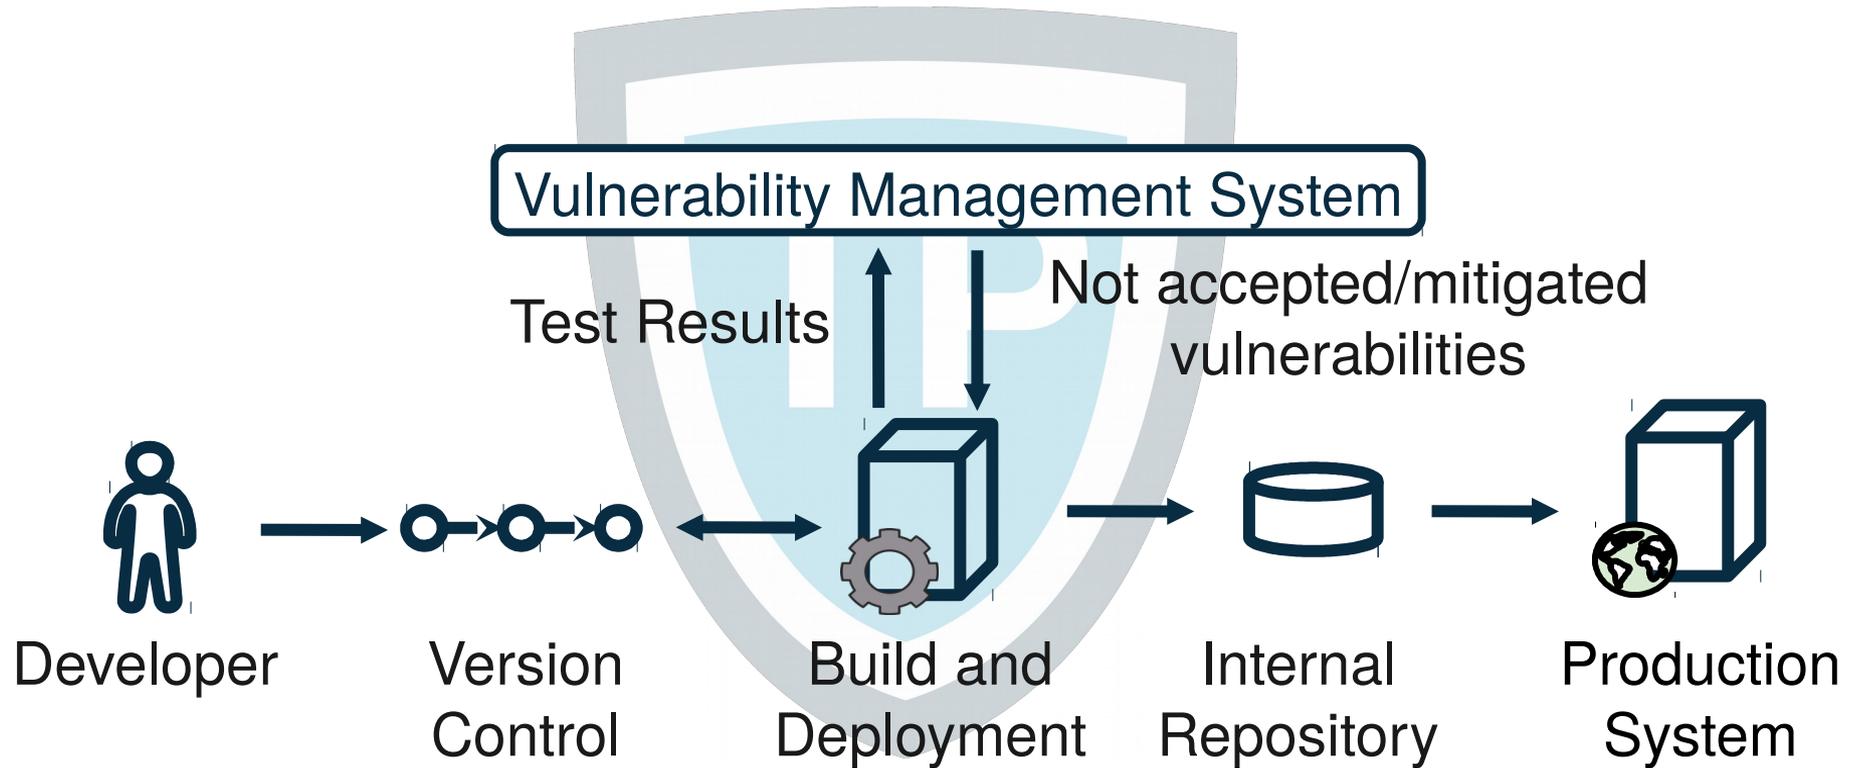

- Vulnerabilities with criticality greater than medium:  
MUST be handled
- Vulnerabilities with criticality low and medium:  
SHOULD be handled  
→ Not part of automatic quality gate

# Scan System

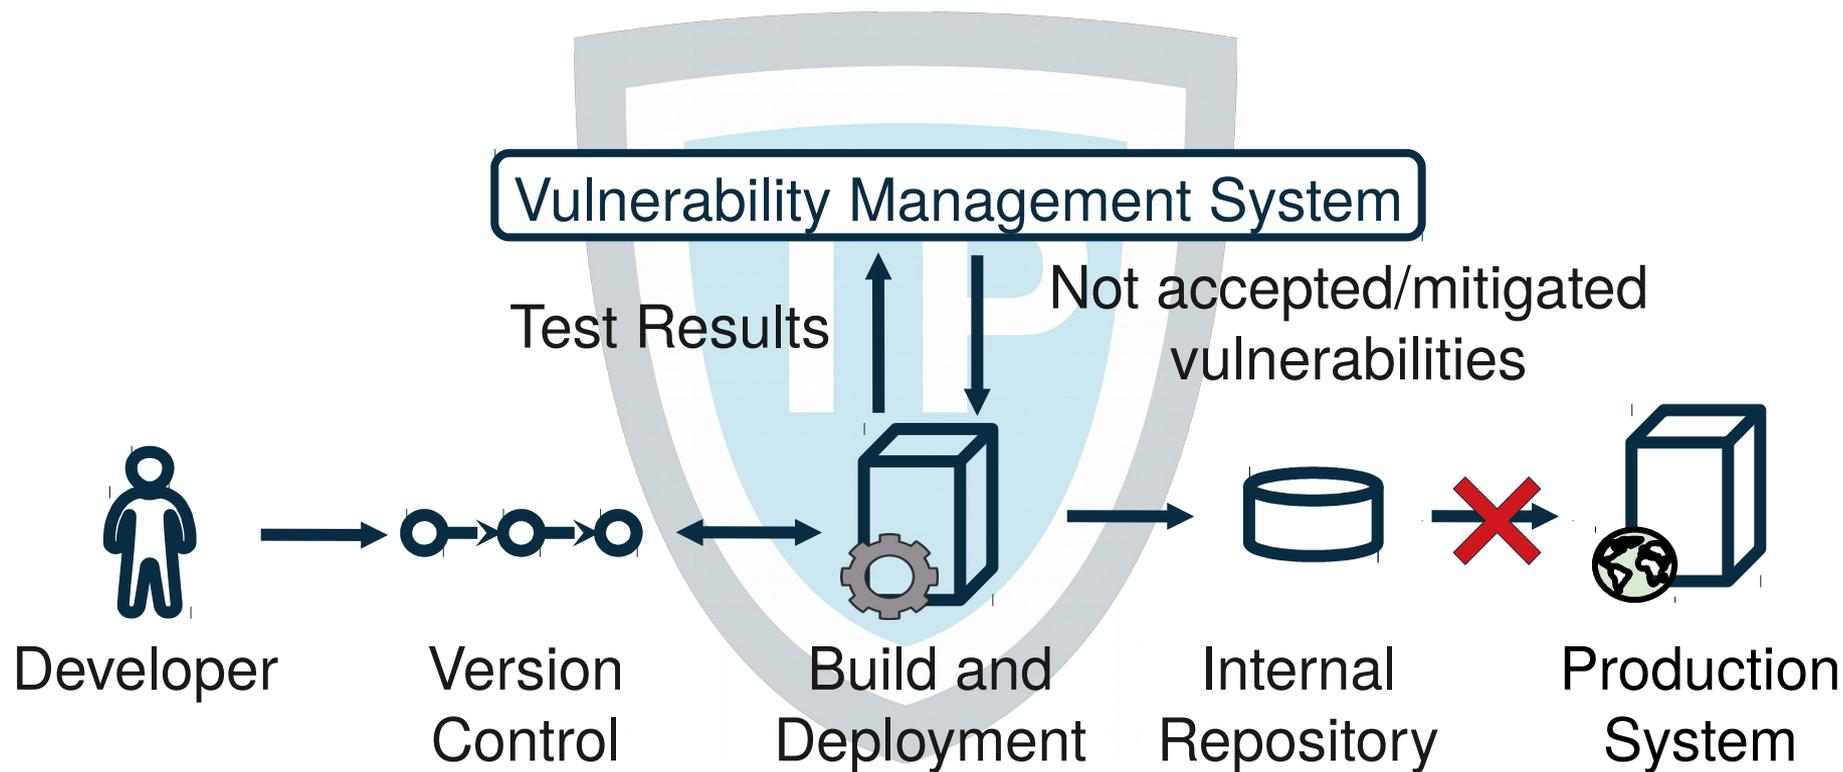

---

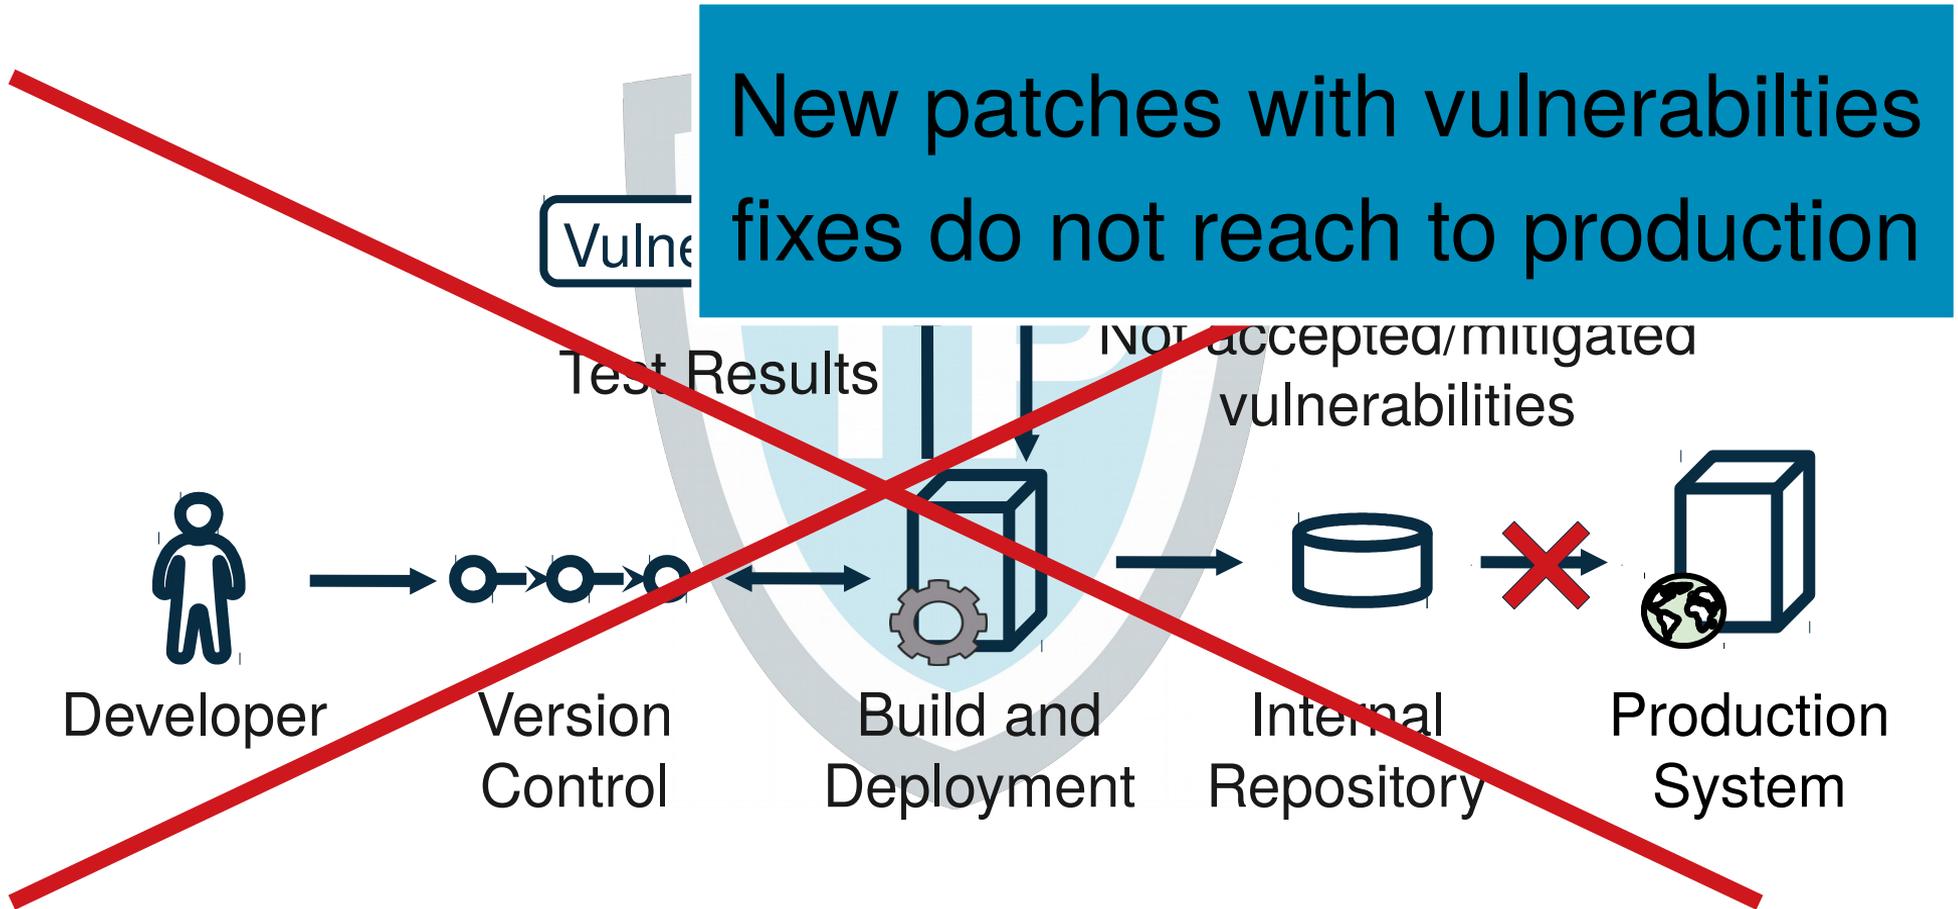

# Continuous Integration: Image Scanning

# Continuous Integration: Image Scanning

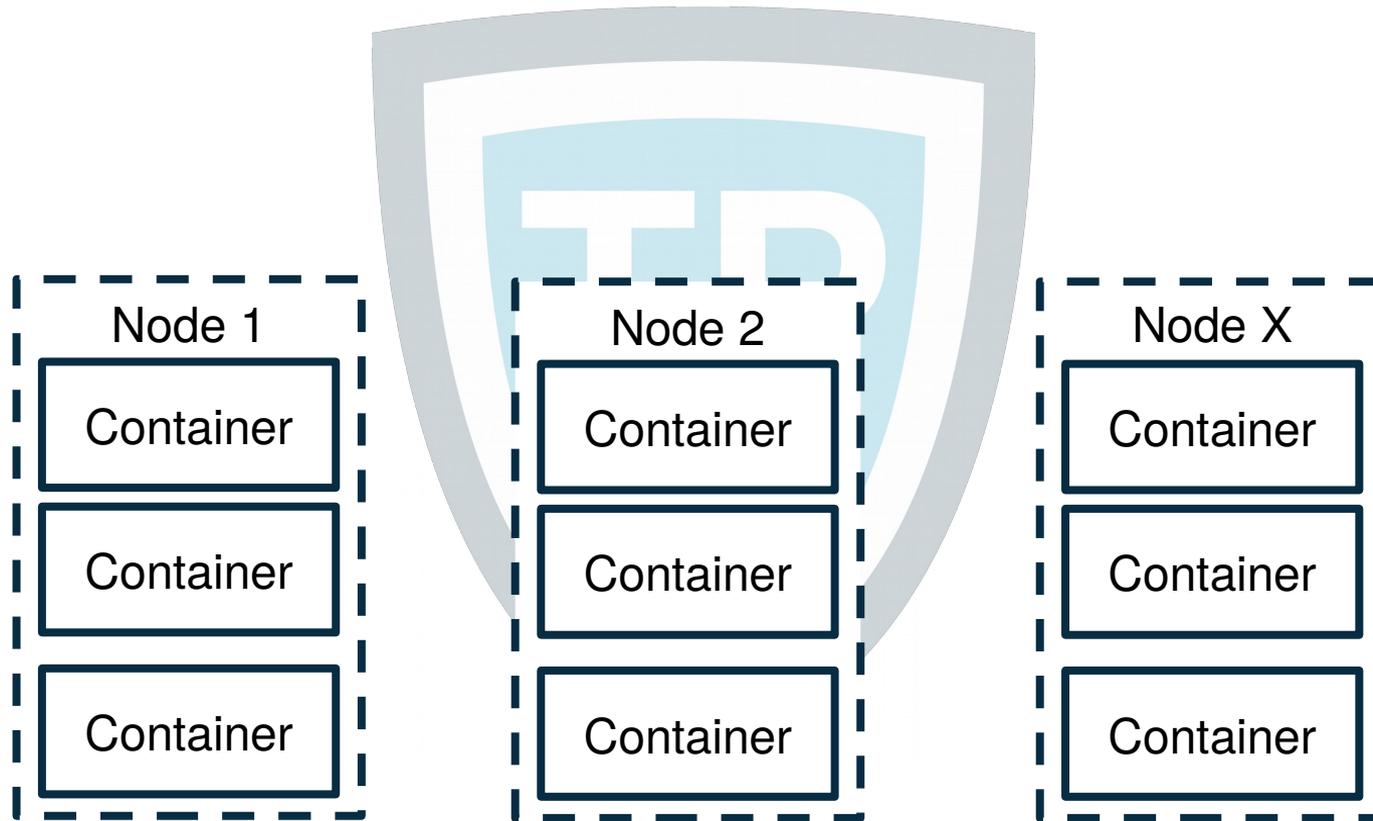

# Continuous Integration: Image Scanning

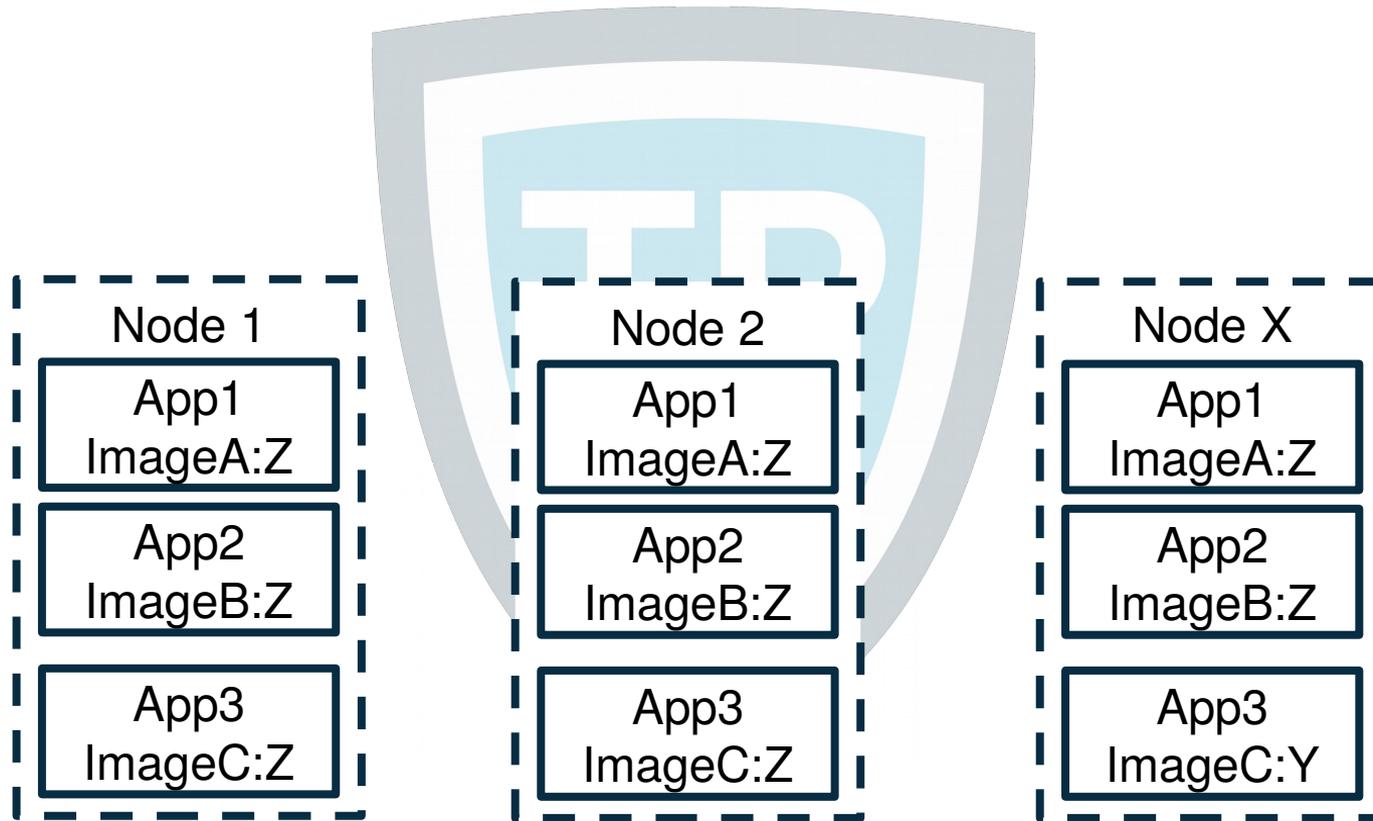

# Process to Scan Images

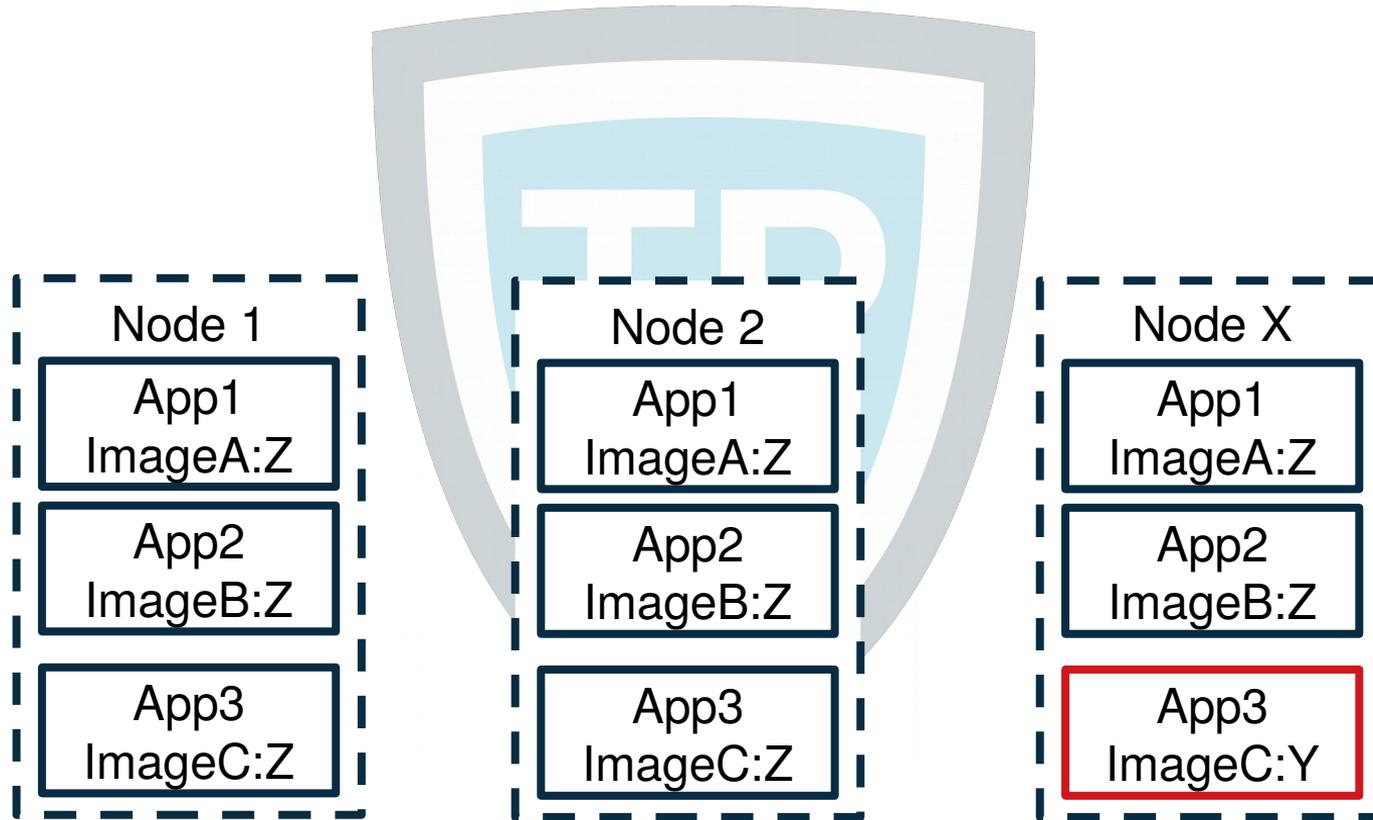

---

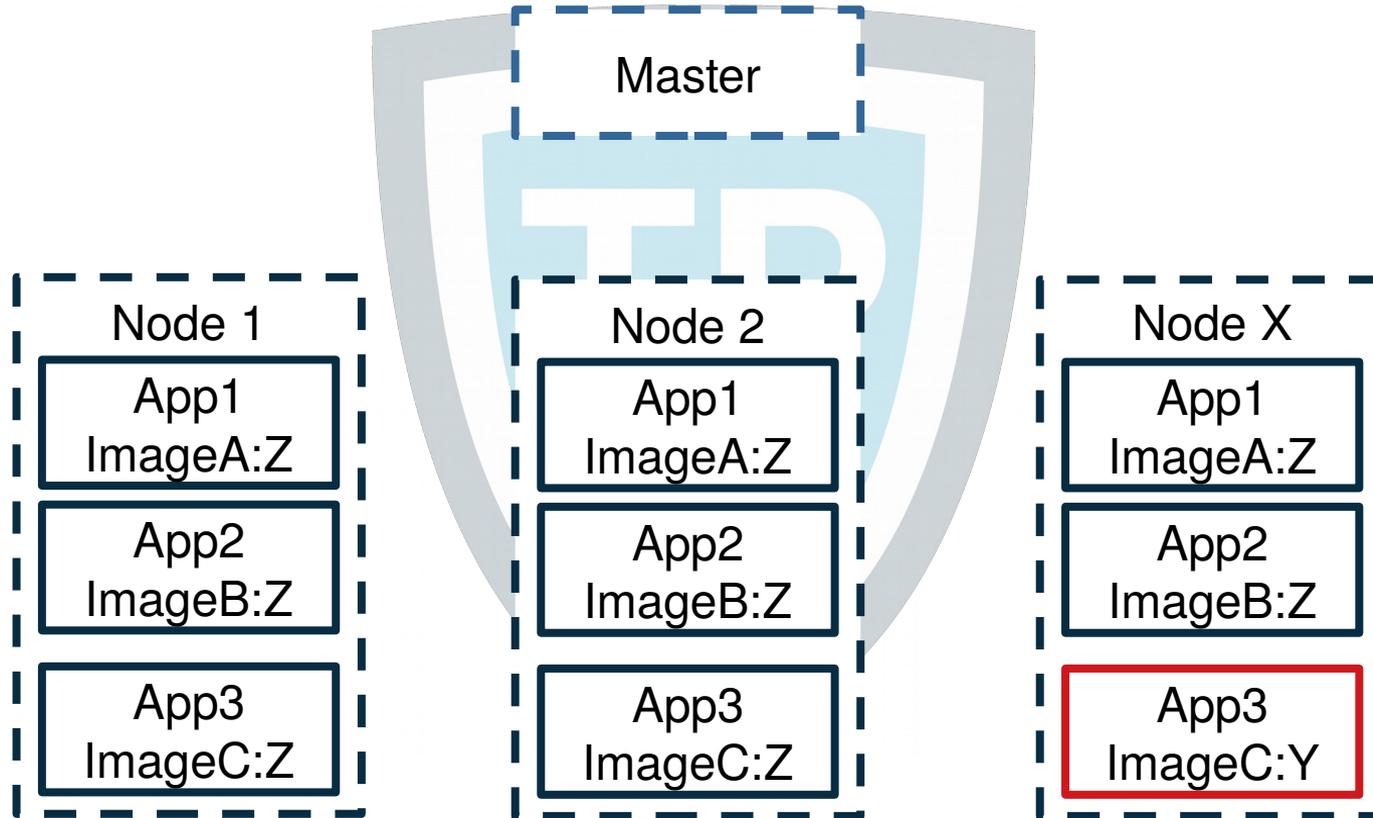

# Process to Scan Images

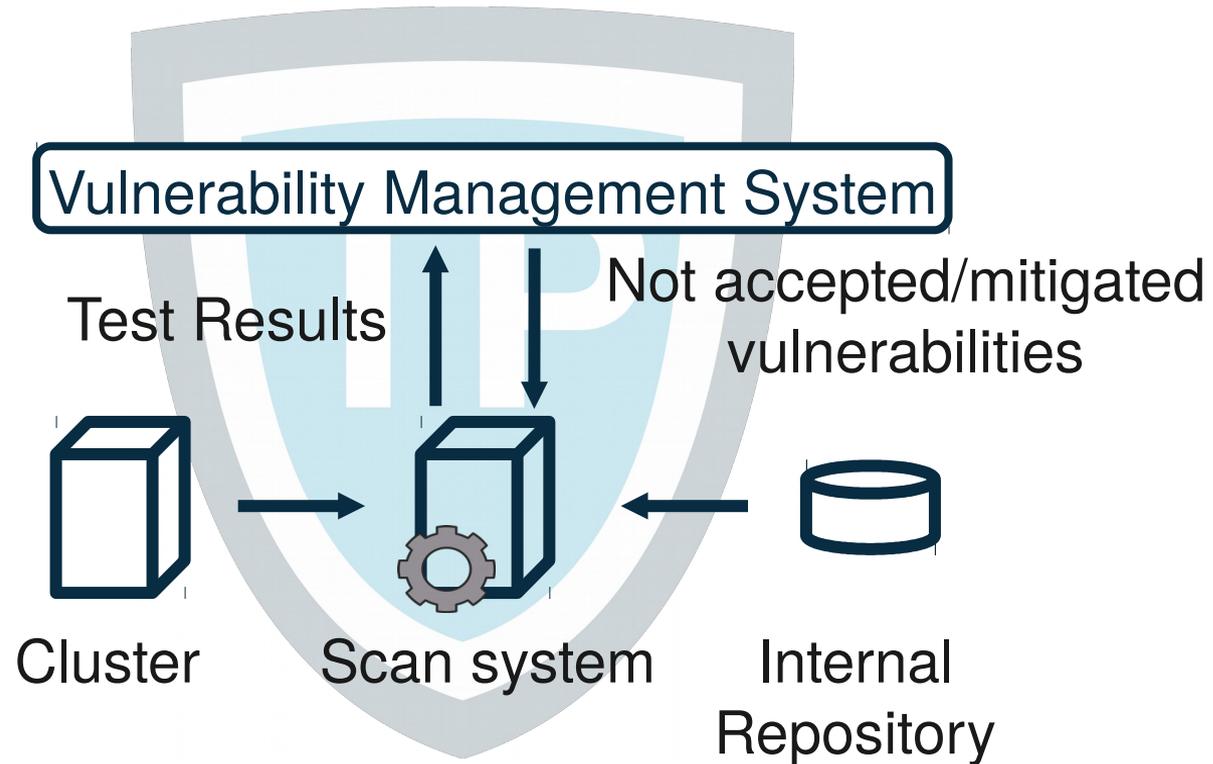

# Process to Scan Images

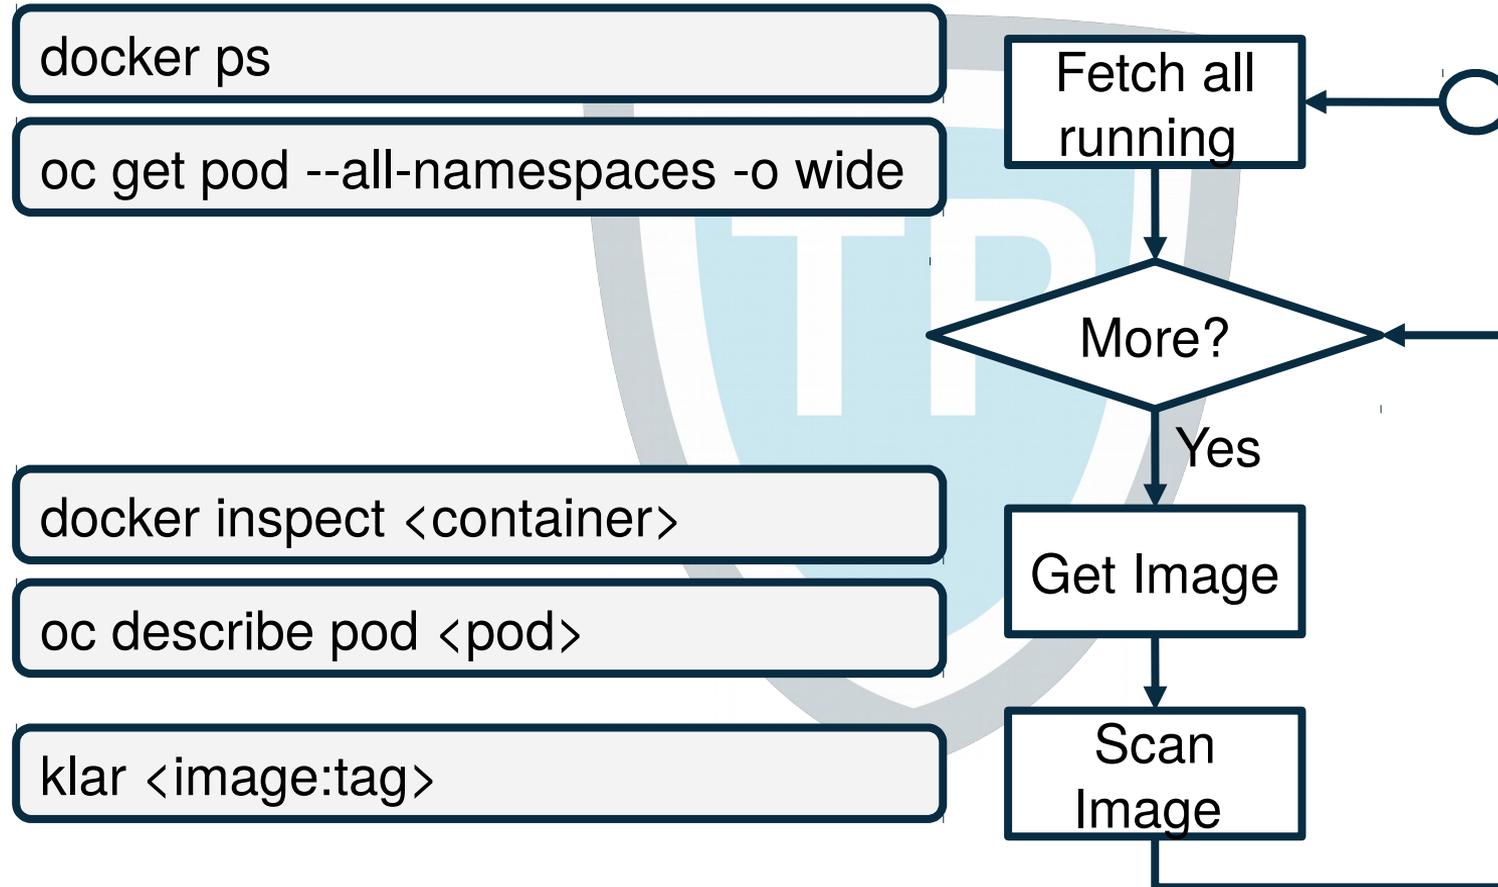

# Process to Scan Images

# Scan System

# Process to Scan Images

# Praxis Tipp

---

- Original images (e.g. nginx) often copy compiled version
  - No package manager
  - No dependencies (Open Source)
  - No Vulnerabilities

# Praxis Tipp

---

- Original images (e.g. nginx) often copy compiled version
  - No package manager
  - No dependencies (Open Source)
  - No Vulnerabilities
  - Meta package (same version)

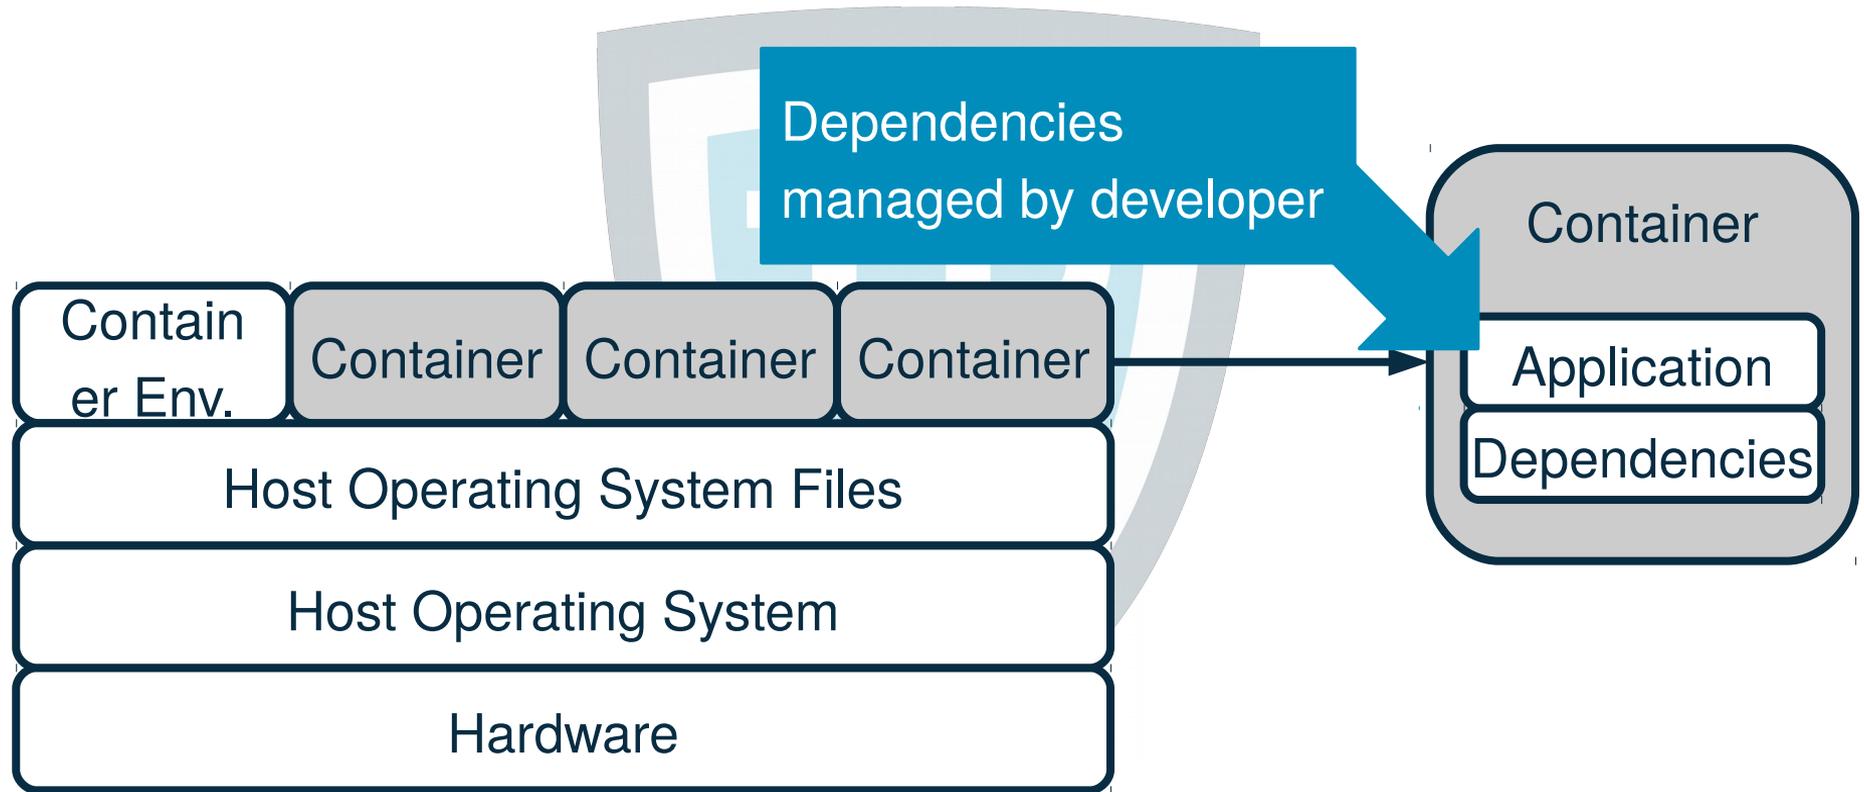

# Image Inheritance Tree

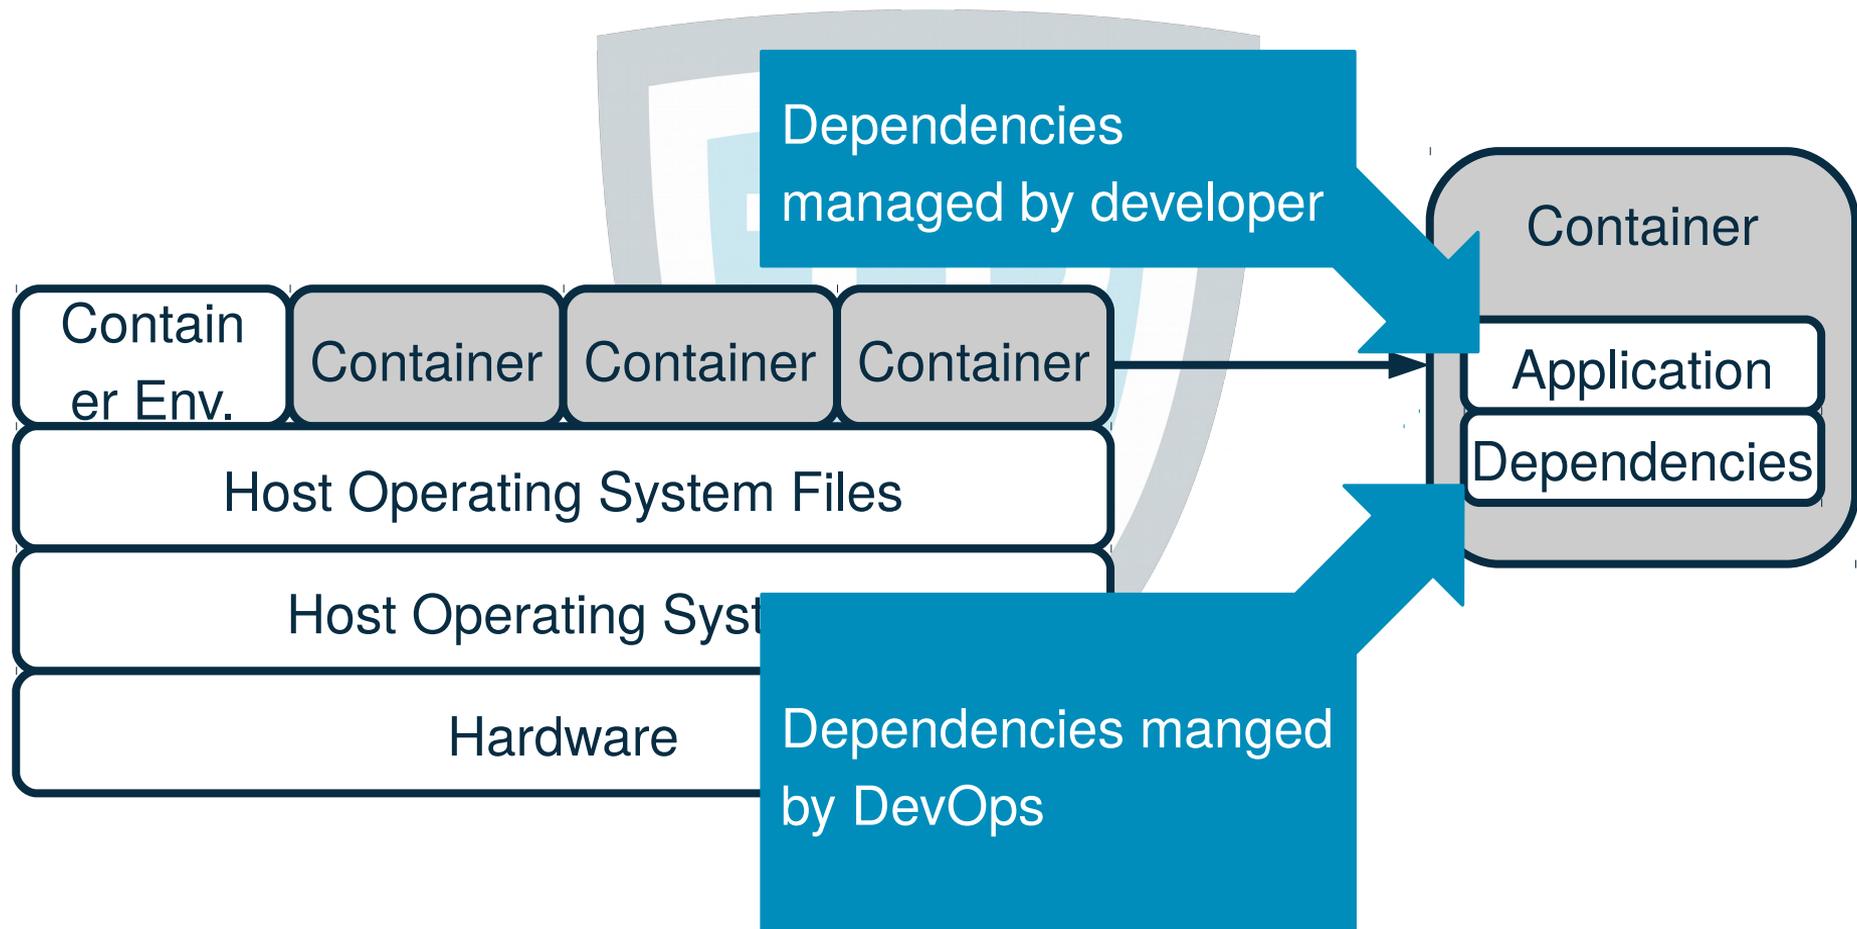

# Simplified RACI Matrix

Role	Responsible	Accountable	Consulted	Informed
DevOps-Manager		X		
DevOps-Team	X			
CTO (No Patch)			X	
Customers / Projects				X

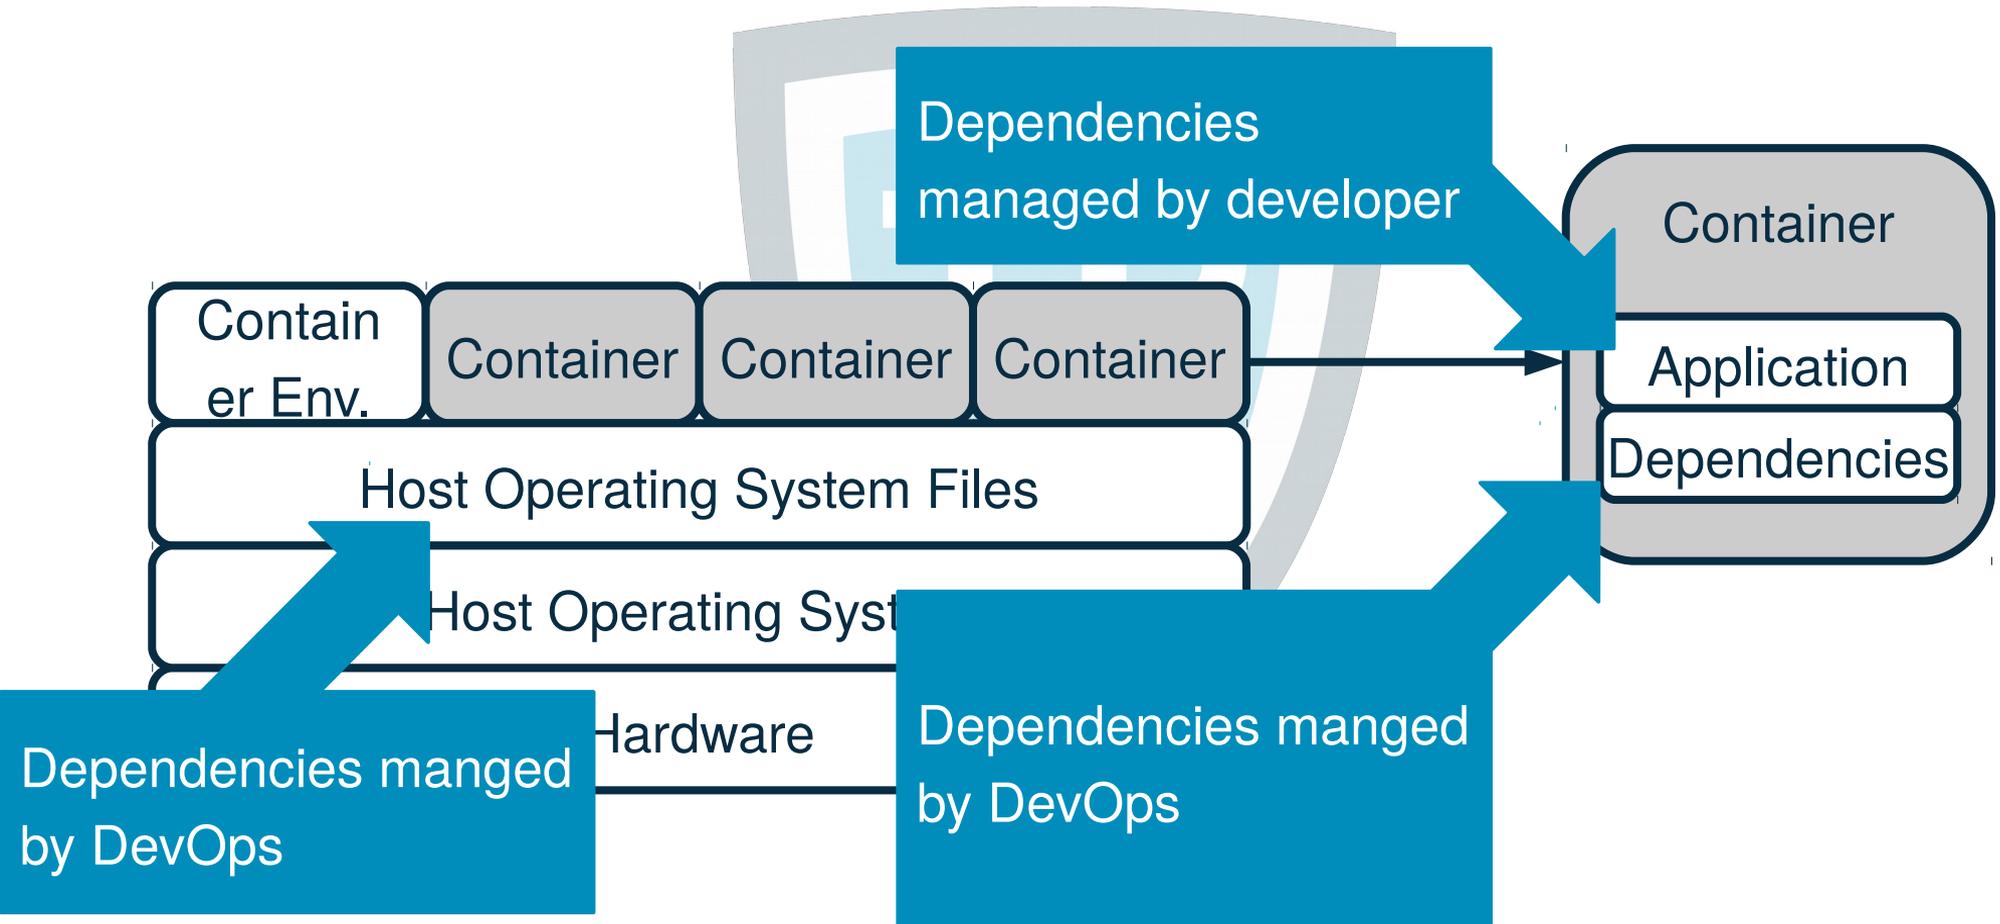

# Patch-Responsibilities

# Patch-Responsibilities

# Patch-Responsibilities

# Responding to a Vulnerability

---

- Transfer
- Avoid
- Mitigate, or
- Accept the risk

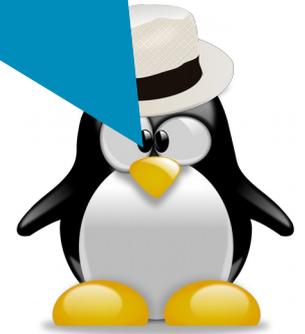

# Responding to a Vulnerability

---

- Transfer
- Avoid
- Mitigate, or
- Accept the risk (e.g. temporarily)

Whom of you accept all risks?

# Scenario: Critical Vulnerability in *glibc*

---

## What will you do?

- Fix it by yourself (do you have C/C++ developers?)
- Decommission system
- Transfer risk
- Accept (wait for patch in distribution)

# Example Denial of Service

## CVE-2017-8804

<b>Name</b>	CVE-2017-8804
<b>Description</b>	The xdr_bytes and xdr_string functions in the GNU C Library (aka glibc or libc6) 2.25 mishandle failures of buffer deserialization, which allows remote attackers to cause a denial of service (virtual memory allocation or memory consumption if an overcommit setting is not used) via a crafted UDP packet to port 111, a related issue to CVE-2017-8779.
<b>Source</b>	<a href="#">CVE</a> (at <a href="#">NVD</a> ; <a href="#">CERT</a> , <a href="#">LWN</a> , <a href="#">oss-sec</a> , <a href="#">fulldisc</a> , <a href="#">bugtraq</a> , <a href="#">EDB</a> , <a href="#">Metasploit</a> , <a href="#">Red Hat</a> , <a href="#">Ubuntu</a> , <a href="#">Gentoo</a> , <a href="#">SuSE</a> , <a href="#">Mageia</a> , <a href="#">GitHub code/issues</a> , <a href="#">web search</a> , <a href="#">more</a> )
<b>NVD severity</b>	high (attack range: remote)
<b>Debian Bugs</b>	<a href="#">862086</a>

# Example CVE-2015-0235

## CVE-2015-0235

<b>Name</b>	CVE-2015-0235
<b>Description</b>	Heap-based buffer overflow in the <code>__nss_hostname_digits_dots</code> function in <code>glibc</code> 2.2, and other 2.x versions before 2.18, allows context-dependent attackers to execute arbitrary code via vectors related to the (1) <code>gethostbyname</code> or (2) <code>gethostbyname2</code> function, aka "GHOST."
<b>Source</b>	<a href="#">CVE</a> (at <a href="#">NVD</a> ; <a href="#">CERT</a> , <a href="#">LWN</a> , <a href="#">oss-sec</a> , <a href="#">fulldisc</a> , <a href="#">bugtraq</a> , <a href="#">EDB</a> , <a href="#">Metasploit</a> , <a href="#">Red Hat</a> , <a href="#">Ubuntu</a> , <a href="#">Gentoo</a> , <a href="#">SUSE bugzilla/CVE</a> , <a href="#">Mageia</a> , <a href="#">GitHub code/issues</a> , <a href="#">web search</a> , <a href="#">more</a> )
<b>References</b>	<a href="#">DLA-139-1</a> , <a href="#">DSA-3142-1</a>
<b>NVD severity</b>	high (attack range: remote)
<b>Debian Bugs</b>	<a href="#">776391</a>

# Agenda

---

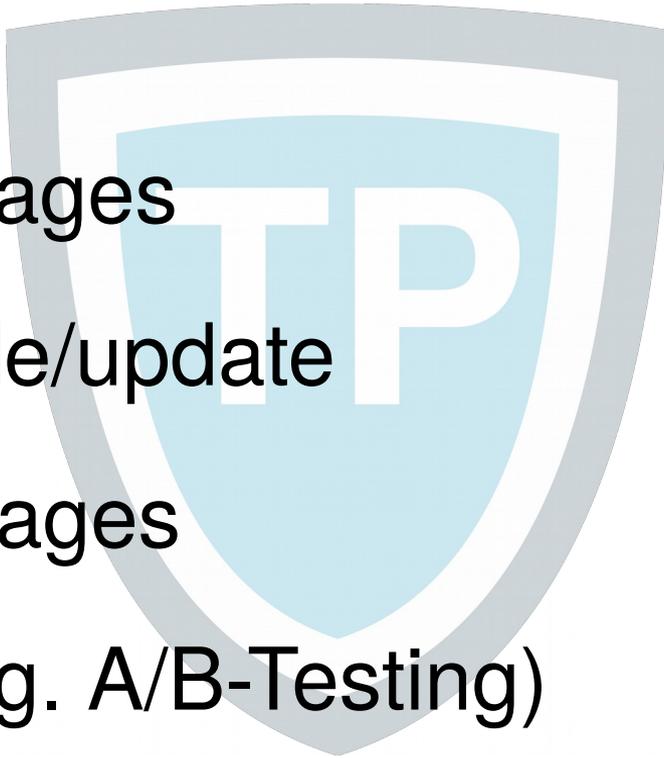

- Introduction
- Strategies to Handle Patchmanagement
- Scanning for Known Vulnerabilities
- Fast Patching
- Conclusion

# Periodical Patch Management with Containers

---

Nightly/Weekly:

- Pull external images
- Perform upgrade/update
- Build project images
- Test images (e.g. A/B-Testing)
- Destroy and start containers

# Pitfalls

---

- Image caching during build (no change → old version)
- CentOS: *yum update --security*

# Fail Secure?

← → ↻  https://bugs.centos.org/view.php?id=3578

CentOS Bug Tracker

## Activities

 **kbsingh@karan.org**

 2009-04-26 14:36

administrator  ~0009256

we dont support yum security in any of the centos repos at the moment

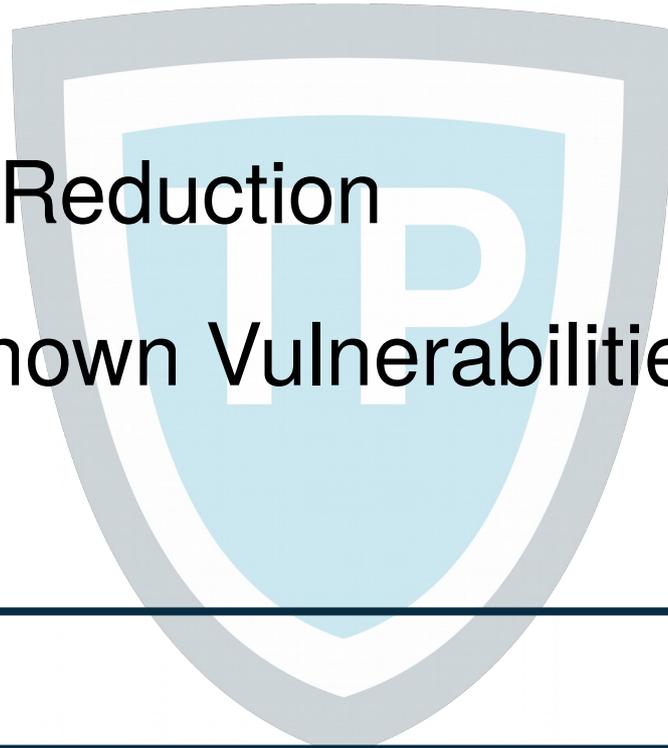

# Image Updates

# Agenda

---

- Introduction
- Attack Surface Reduction
- Scanning for Known Vulnerabilities
- Fast Patching
- Conclusion

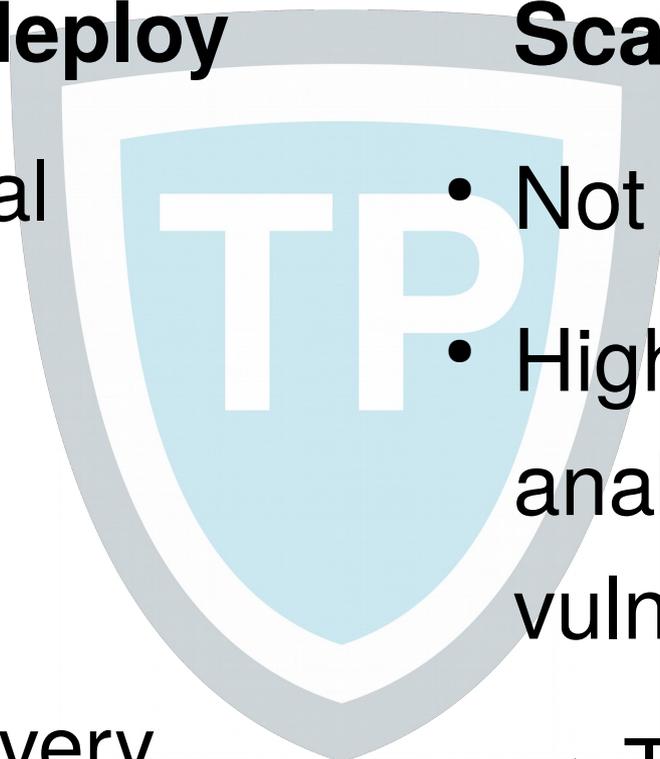

## Nightly build+deploy

- Good for external images
- High testing requirement
- Continuous Delivery required

## Scanning

- Not blind
  - High effort in analysing vulnerabilities
- Time consuming

# Conclusion

---

- Patching is not easy
- Detection of vulnerabilities in running containers
- Quality gates are important and a centralized vulnerability management (system)

---
